

# **Datasheet**

## **ES9650 IPM for Three-phase Motor Control**

Fortior Technology Co., Ltd.

**Contents**

<b>Explanation of Symbols.....</b>	<b>17</b>
<b>Abbreviations.....</b>	<b>18</b>
<b>1 System Introduction .....</b>	<b>20</b>
1.1 Features .....	20
1.2 Applications .....	21
1.3 Overview.....	21
1.4 Functional Block Diagram.....	22
1.4.1 ES9650.....	22
1.5 Memory Organization.....	23
1.5.1 Program Memory.....	23
1.5.2 Data Memory.....	23
1.5.3 SFR.....	24
1.5.4 XSFR.....	25
<b>2 Pin Definitions .....</b>	<b>27</b>
2.1 ES9650 QHFBP8080-60L Pins .....	27
2.2 ES9650 QHFBP8080-60LPinout Diagram.....	30
<b>3 Package Information.....</b>	<b>31</b>
3.1 QHFBP8080-60L_8x8 .....	31
<b>4 Ordering Information.....</b>	<b>32</b>
<b>5 Electrical Characteristics .....</b>	<b>33</b>
5.1 Absolute Maximum Ratings .....	33
5.2 Global Electrical Characteristics.....	33
5.3 GPIO Electrical Characteristics .....	34
5.4 ADC Electrical Characteristics.....	34
5.5 VREF Electrical Characteristics .....	35
5.6 Operational Amplifier Electrical Characteristics .....	35
5.7 BEMF Electrical Characteristics .....	35
5.8 OSC Electrical Characteristics.....	36
5.9 Reset Electrical Characteristics .....	36
5.10 LDO Electrical Characteristics.....	36
5.11 Package Thermal Resistance.....	36
<b>6 Reset Control.....</b>	<b>37</b>
6.1 Reset Sources (RST_SR).....	37

6.2 Reset Enable .....	37
6.3 External Reset and Power-on Reset.....	37
6.4 Low Voltage Detector Reset .....	37
6.5 Watchdog Timer Reset .....	37
6.6 Flash Error Detector Reset.....	37
6.7 Debug Reset.....	38
6.8 Soft Reset.....	38
6.9 Reset Registers.....	38
6.9.1 RST_SR (0xC9).....	38
<b>7 Interrupt.....</b>	<b>39</b>
7.1 Interrupt Introduction.....	39
7.2 Interrupt Enable.....	39
7.3 External Interrupt.....	39
7.4 Interrupt Summary .....	40
7.5 Interrupt Registers .....	41
7.5.1 IE (0xA8) .....	41
7.5.2 IP0 (0xB8) .....	41
7.5.3 IP1 (0xC0) .....	42
7.5.4 IP2 (0xC8) .....	42
7.5.5 IP3 (0xD8).....	42
7.5.6 TCON (0x88) .....	43
7.5.7 P1_IE (0xD1).....	43
7.5.8 P1_IF (0xD2).....	44
7.5.9 P2_IE (0xD3).....	44
7.5.10 P2_IF (0xD4).....	45
<b>8 I<sup>2</sup>C.....</b>	<b>47</b>
8.1 I <sup>2</sup> C Introduction.....	47
8.2 I <sup>2</sup> C Operations.....	48
8.2.1 Master Mode .....	48
8.2.2 Slave Mode.....	48
8.2.3 I <sup>2</sup> C Interrupt Sources .....	49
8.3 I <sup>2</sup> C Registers .....	49
8.3.1 I2C_CR (0x4028).....	49
8.3.2 I2C_ID (0x4029).....	50
8.3.3 I2C_DR (0x402A) .....	50

8.3.4 I2C_SR (0x402B).....	50
<b>9 UART.....</b>	<b>53</b>
9.1 Introduction.....	53
9.2 UART Operations.....	53
9.2.1 UART1 Operating Instructions.....	53
9.2.1.1 UART1 Mode0.....	53
9.2.1.2 UART1 Mode1.....	53
9.2.1.3 UART1 Mode2.....	54
9.2.1.4 UART1 Mode3.....	54
9.2.1.5 UART1 Interrupt.....	54
9.2.2 UART2 Operating Instructions.....	54
9.2.2.1 UART2 Mode0.....	54
9.2.2.2 UART2 Mode1.....	55
9.2.2.3 UART2 Mode2.....	55
9.2.2.4 UART2 Mode3.....	55
9.2.2.5 UART2 Interrupt.....	56
9.3 UART1 Registers.....	56
9.3.1 UT_CR (0x98).....	56
9.3.2 UT_DR (0x99).....	56
9.3.3 UT_BAUD (0x9A, 0x9B).....	57
9.4 UART2 Registers.....	58
9.4.1 UT2_CR (0x8A).....	58
9.4.2 UT2_DR (0x89).....	58
9.4.3 UT2_BAUD (0x4042, 0x4043).....	59
<b>10 MDU.....</b>	<b>60</b>
10.1 MDU Introduction.....	60
10.2 MDU Features.....	60
10.3 MDU Instructions.....	60
10.3.1 MDU Operations.....	60
10.3.2 16-bit Signed Multiplication with the Result Shifted Left by 1 Bit.....	60
10.3.3 16-bit Signed Multiplication.....	61
10.3.4 16-bit Unsigned Multiplication.....	61
10.3.5 32-bit/16-bit Unsigned Division.....	61
10.3.6 Low-Pass Filter.....	62
10.3.7 Coordinate Transformation.....	62

10.3.8 Arctangent.....	63
10.4 MDU Registers .....	64
10.4.1 MDU_CR (0xC1).....	64
10.4.2 MDU_MD (0xCA).....	64
10.4.3 MDU_A (0xC7, 0xC6) .....	65
10.4.4 MDU_B (0xC5, 0xC4).....	66
10.4.5 MDU_C (0xC3, 0xC2).....	67
10.4.6 MDU_D (0xCB).....	67
<b>11 PI/PID.....</b>	<b>68</b>
11.1 PI/PID Introduction .....	68
11.2 PI/PID Features .....	68
11.3 PI/PID Operations .....	68
11.4 PI/PID Registers.....	69
11.4.1 PI_CR (0xF9) .....	69
11.4.2 PIO_KP (0x02E0, 0x02E1).....	70
11.4.3 PIO_KI (0x02E2, 0x02E3).....	70
11.4.4 PIO_UKMAX (0x02E4, 0x02E5).....	70
11.4.5 PIO_UKMIN (0x02E6, 0x02E7).....	71
11.4.6 PIO_EK1 (0x02E8, 0x02E9) .....	71
11.4.7 PIO_EK (0x02EA, 0x02EB) .....	71
11.4.8 PIO_UKH (0x02EC, 0x02ED).....	72
11.4.9 PIO_UKL (0x02EE, 0x02EF) .....	72
11.4.10 PI1_KP (0x02D0, 0x02D1).....	72
11.4.11 PI1_KI (0x02D2, 0x02D3).....	73
11.4.12 PI1_UKMAX (0x02D4, 0x02D5).....	73
11.4.13 PI1_UKMIN (0x02D6, 0x02D7) .....	73
11.4.14 PI1_EK1 (0x02D8, 0x02D9).....	74
11.4.15 PI1_EK (0x02DA, 0x02DB) .....	74
11.4.16 PI1_UKH (0x02DC, 0x02DD) .....	74
11.4.17 PI1_UKL (0x02DE, 0x02DF).....	75
11.4.18 PI2_KP (0x02BC, 0x02BD).....	75
11.4.19 PI2_KI (0x02BE, 0x02BF).....	75
11.4.20 PI2_UKMAX (0x02C0, 0x02C1) .....	76
11.4.21 PI2_UKMIN (0x02C2, 0x02C3).....	76
11.4.22 PI2_EK1 (0x02C4, 0x02C5).....	76

11.4.23 PI2_EK (0x02C6, 0x02C7).....	77
11.4.24 PI2_UKH (0x02C8, 0x02C9).....	77
11.4.25 PI2_UKL (0x02CA, 0x02CB).....	77
11.4.26 PI2_KD (0x02CC, 0x02CD).....	78
11.4.27 PI2_EK2 (0x02CE, 0x02CF).....	78
11.4.28 PI3_KP (0x02A8, 0x02A9).....	78
11.4.29 PI3_KI (0x02AA, 0x02AB).....	79
11.4.30 PI3_UKMAX (0x02AC, 0x02AD).....	79
11.4.31 PI3_UKMIN (0x02AE, 0x02AF).....	79
11.4.32 PI3_EK1 (0x02B0, 0x02B1).....	80
11.4.33 PI3_EK (0x02B2, 0x02B3).....	80
11.4.34 PI3_UKH (0x02B4, 0x02B5).....	80
11.4.35 PI3_UKL (0x02B6, 0x02B7).....	81
11.4.36 PI3_KD (0x02B8, 0x02B9).....	81
11.4.37 PI3_EK2 (0x02BA, 0x02BB).....	81
<b>12 FOC.....</b>	<b>82</b>
12.1 FOC Overview.....	82
12.1.1 FOC Introduction.....	82
12.1.2 Reference Voltage (VREF) Input.....	82
12.1.3 PI Controller.....	82
12.1.4 Coordinate Transformations.....	83
12.1.4.1 Inverse Park Transformation.....	83
12.1.4.2 Inverse Clarke Transformation.....	84
12.1.4.3 Clarke Transformation.....	84
12.1.4.4 Park Transformation.....	85
12.1.5 SVPWM.....	85
12.1.5.1 Continuous SVPWM.....	87
12.1.5.2 Discontinuous SVPWM.....	87
12.1.6 Overmodulation.....	87
12.1.7 Deadtime Compensation.....	87
12.1.8 Current and Voltage Sampling.....	87
12.1.8.1 Single-shunt Current Sampling Mode.....	88
12.1.8.2 Dual/Triple-shunt Current Sampling Mode.....	90
12.1.8.3 Current Sampling Offset.....	91
12.1.9 Angle Mode.....	91

12.1.9.1 Forced Ramping Angle .....	92
12.1.9.2 Forced Pulling Angle.....	92
12.1.9.3 Estimator Angle.....	93
12.1.9.3.1 Estimated Angle of Estimator .....	93
12.1.9.3.2 Forced Angle of Estimator .....	93
12.1.9.3.3 Angle Smooth Switching.....	94
12.1.9.3.4 Angle Compensation .....	94
12.1.10 Motor Real Time Parameters.....	94
12.1.10.1 RSD.....	95
12.1.10.2 BEMF Detection .....	95
12.1.10.3 Motor Power.....	95
12.1.11 FG Generation.....	95
12.2 FOC Registers.....	96
12.2.1 FOC_CR0 (0x409F).....	96
12.2.2 FOC_CR1 (0x40A0).....	96
12.2.3 FOC_CR2 (0x40A1).....	97
12.2.4 FOC_TSMIN (0x40A2).....	98
12.2.5 FOC_TGLI (0x40A3).....	98
12.2.6 FOC_TBLO (0x40A4).....	98
12.2.7 FOC_TRGDLY (0x40A5).....	99
12.2.8 FOC_CSO (0x40A6, 0x40A7).....	99
12.2.9 FOC__RTHESTEP (0x40A8, 0x40A9).....	99
12.2.10 FOC_RTHEACC (0x40AA, 0x40AB).....	100
12.2.11 FOC_EOMELPF (0x40AA, 0x40AB).....	100
12.2.12 FOC_RTHECNT (0x40AC).....	100
12.2.13 FOC_THECOR (0x40AD).....	101
12.2.14 FOC__EMF (0x40AE, 0x40AF).....	101
12.2.15 FOC_THECOMP (0x40AE, 0x40AF).....	101
12.2.16 FOC_DMAX (0x40B0, 0x40B1).....	102
12.2.17 FOC_DMIN (0x40B2, 0x40B3).....	102
12.2.18 FOC_QMAX (0x40B4, 0x40B5).....	102
12.2.19 FOC_QMIN (0x40B6, 0x40B7).....	103
12.2.20 FOC__UD (0x40B8, 0x40B9).....	103
12.2.21 FOC__UQ (0x40BA, 0x40BB).....	103
12.2.22 FOC__ID (0x40BC, 0x40BD).....	104

12.2.23 FOC__IQ (0x40BE, 0x40BF).....	104
12.2.24 FOC__IBET (0x40C0, 0x40C1) .....	104
12.2.25 FOC__VBET (0x40C2, 0x40C3).....	105
12.2.26 FOC__VALP (0x40C4, 0x40C5).....	105
12.2.27 FOC__UDCPS (0x40C2, 0x40C3).....	105
12.2.28 FOC__UQCPS (0x40C4, 0x40C5) .....	106
12.2.29 FOC__IC (0x40C6, 0x40C7).....	106
12.2.30 FOC__IB (0x40C8, 0x40C9).....	106
12.2.31 FOC__IA (0x40CA, 0x40CB).....	107
12.2.32 FOC__THETA (0x40CC, 0x40CD).....	107
12.2.33 FOC__ETHETA (0x40CE, 0x40CF) .....	107
12.2.34 FOC__EALP (0x40D0, 0x40D1).....	108
12.2.35 FOC__EBET (0x40D2, 0x40D3).....	108
12.2.36 FOC__EOME (0x40D4, 0x40D5).....	108
12.2.37 FOC__UQEX (0x40D6, 0x40D7).....	109
12.2.38 FOC__KFG (0x40D6, 0x40D7).....	109
12.2.39 FOC__POW (0x40D8, 0x40D9) .....	109
12.2.40 FOC__EOMEKLPF (0x40D8).....	110
12.2.41 FOC__IAMAX (0x40DA, 0x40DB).....	110
12.2.42 FOC__IBMAX (0x40DC, 0x40DD).....	110
12.2.43 FOC__ICMAX (0x40DE, 0x40DF).....	111
12.2.44 FOC__EFREQMAX (0x406F).....	111
12.2.45 FOC__EKP (0x4074, 0x4075) .....	111
12.2.46 FOC__EKI (0x4076, 0x4077) .....	112
12.2.47 FOC__EBMFK (0x407C, 0x407D).....	112
12.2.48 FOC__KSLIDE (0x4078, 0x4079).....	112
12.2.49 FOC__EKLPFMIN (0x407A, 0x407B) .....	113
12.2.50 FOC__OMEKLPF (0x407E, 0x407F).....	113
12.2.51 FOC__FBASE (0x4080, 0x4081) .....	113
12.2.52 FOC__EFREQACC (0x4082, 0x4083).....	114
12.2.53 FOC__EFREQMIN (0x4084, 0x4085) .....	114
12.2.54 FOC__EFREQHOLD (0x4086, 0x4087).....	115
12.2.55 FOC__EK3 (0x4088, 0x4089) .....	115
12.2.56 FOC__EK4 (0x408A, 0x408B).....	115
12.2.57 FOC__EK1 (0x408C, 0x408D) .....	116

12.2.58 FOC_EK2 (0x408E, 0x408F) .....	116
12.2.59 FOC_IDREF (0x4090, 0x4091).....	116
12.2.60 FOC_IQREF (0x4092, 0x4093) .....	117
12.2.61 FOC_DQKP (0x4094, 0x4095).....	117
12.2.62 FOC_DQKI (0x4096, 0x4097).....	117
12.2.63 FOC__UDCFLT (0x4098, 0x4099).....	118
<b>13 Timer1.....</b>	<b>119</b>
13.1 Timer1 Operations.....	119
13.1.1 Timer1 Counter Module.....	120
13.1.1.1 Prescaler.....	120
13.1.1.2 Basic Timer .....	121
13.1.1.3 Reload Timer .....	122
13.1.2 Position Detection.....	122
13.1.2.1 Position Detection Signal.....	122
13.1.2.2 CMP/GPIO Position Detection Event.....	122
13.1.2.4 Sampling.....	124
13.1.2.5 Filtering .....	125
13.1.3 Writing Sequence Event .....	125
13.1.4 Timer1 Interrupt.....	125
13.2 Square Wave Control Based BLDC Motor.....	126
13.2.1 Six-step Phase Commutation of Square Wave Control.....	127
13.2.2 Square Wave Control Working Principle.....	128
13.2.2.1 60° Commutation Base Time .....	128
13.2.2.2 Forced Commutation at 60° .....	128
13.2.2.3 Diode Freewheeling Masking.....	129
13.2.2.4 Angle of Position Detected to Commutation .....	129
13.2.2.5 Cycle-by-Cycle Current Limiting.....	129
13.3 Timer1 Registers .....	130
13.3.1 TIM1_CR0 (0x4068).....	130
13.3.2 TIM1_CR1 (0x4069).....	131
13.3.3 TIM1_CR2 (0x406A) .....	131
13.3.4 TIM1_CR3 (0x406B) .....	131
13.3.5 TIM1_CR4 (0x406C).....	132
13.3.6 TIM1_IER (0x406D) .....	132
13.3.7 TIM1_SR (0x406E).....	133

13.3.8 TIM1__BCOR (0x4070, 0x4071) .....	134
13.3.9 TIM1__DBR1 (0x4074, 0x4075) .....	135
13.3.10 TIM1__DBR2 (0x4076, 0x4077) .....	136
13.3.11 TIM1__DBR3 (0x4078, 0x4079) .....	137
13.3.12 TIM1__DBR4 (0x4080, 0x4081) .....	138
13.3.13 TIM1__DBR5 (0x4082, 0x4083) .....	139
13.3.14 TIM1__DBR6 (0x4084, 0x4085) .....	140
13.3.15 TIM1__DBR7 (0x4086, 0x4087) .....	141
13.3.16 TIM1__BCNTR (0x4082, 0x4083) .....	142
13.3.17 TIM1__BCCR (0x4084, 0x4085) .....	142
13.3.18 TIM1__BARR (0x4086, 0x4087) .....	142
13.3.19 TIM1__RARR (0x4088, 0x4089) .....	143
13.3.20 TIM1__RCNTR (0x408A, 0x408B) .....	143
13.3.21 TIM1__UCOP (0x408C, 0x408D) .....	143
13.3.22 TIM1__UFLP (0x408E, 0x408F) .....	144
13.3.23 TIM1__URES (0x4090, 0x4091) .....	144
13.3.24 TIM1__UIGN (0x4092, 0x4093) .....	144
13.3.25 TIM1__KF (0x4094, 0x4095) .....	145
13.3.26 TIM1__KR (0x4096, 0x4097) .....	145
13.3.27 TIM1__ITRIP (0x4098, 0x4099) .....	145
<b>14 Timer2.....</b>	<b>147</b>
14.1 Timer2 Instructions.....	147
14.1.1 Prescaler.....	147
14.1.2 Reading, Writing and Counting of TIM2__CNTR.....	147
14.1.3 Output Mode .....	148
14.1.3.1 Reading and Writing of TIM2__ARR/TIM2__DR .....	148
14.1.3.2 High/Low Level Output .....	148
14.1.3.3 PWM Generation .....	148
14.1.3.4 Interrupt Event .....	149
14.1.4 Input Signal Filtering and Edge Detection .....	149
14.1.5 Input Capture Mode.....	150
14.1.6 Input Counter Mode .....	151
14.1.7 QEP & RSD Mode.....	152
14.1.7.1 RSD Comparator Sampling.....	153
14.1.8 Step Mode.....	154

14.2 Timer2 Registers .....	155
14.2.1 TIM2_CR0 (0xA1) .....	155
14.2.2 TIM2_CR1 (0xA9) .....	156
14.2.3 TIM2__CNTR (0xAA, 0xAB).....	157
14.2.4 TIM2__DR (0xAC, 0xAD).....	157
14.2.5 TIM2__ARR (0xAE, 0xAF) .....	158
<b>15 Timer3/Timer4.....</b>	<b>159</b>
15.1 Timer3/Timer4 Instructions.....	159
15.1.1 Prescaler.....	159
15.1.2 Reading, Writing and Counting of TIMx__CNTR.....	159
15.1.3 Output Mode .....	160
15.1.3.1 High/Low Level Output .....	160
15.1.3.2 PWM Generation .....	160
15.1.3.3 Interrupt Event.....	160
15.1.4 Input Signal Filtering and Edge Detection .....	161
15.1.5 Input Capture Mode.....	162
15.1.6 FG Output Mode of Timer4.....	163
15.2 Timer3/Timer4 Registers .....	163
15.2.1 TIMx_CR0 (0x9C/0x9E) (x = 3/4) .....	163
15.2.2 TIMx_CR1 (0x9D/0x9F) (x = 3/4).....	164
15.2.3 TIMx__CNTR (0xA2, 0xA3/0x92, 0x93) (x = 3/4).....	165
15.2.4 TIMx__DR (0xA4, 0xA5/0x94, 0x95) (x = 3/4) .....	165
15.2.5 TIMx__ARR (0xA6, 0xA7/0x96, 0x97) (x = 3/4) .....	165
<b>16 SysTick.....</b>	<b>166</b>
16.1 SysTick Instructions .....	166
16.2 SysTick Registers.....	166
16.2.1 DRV_SR (0x4061) .....	166
16.2.2 SYST_ARR (0x4064, 0x4065) .....	167
<b>17 Driver.....</b>	<b>168</b>
17.1 Driver Instructions .....	168

## Explanation of Symbols

- The symbol “[ ]” following a register indicates a bit in the register. For example, ABCD[XY] indicates the XY bit in ABCD register
- The symbol “x” in a register name indicates similar registers. For example, TIMx\_CR0 indicates TIM3\_CR0 and TIM4\_CR0.
- [m:n] indicates a range of bits. For example, [3:0] means the bits from bit3 to bit0.
- Pm.n indicates the n<sup>th</sup> port of the Portm. For example, P0.0 indicates the 0<sup>th</sup> port of Port0.
- Register read and write symbols:
  - R: Read only
  - W: Write only
  - R/W: Read/write
  - W0: Only 0 can be written
  - W1: Only 1 can be written
- The symbol “-” indicates an invalid or uncertainty value.
- The RMW instruction cannot be used for registers with different read and written representations.
- Q(number) format is to store floating-point numbers using fixed-point numbers. MSB is the sign bit, followed by integer bits and fraction bits, where lower Q bits are assigned to the fractional part and the remaining bits are assigned to the integer part. For example, for Q12, bit15 is the sign bit, bit14 ~ bit12 represent the integer part and bit11 ~ bit0 represent the fraction part. The Q12 format has a decimal range -8 ~ 7.9998 (corresponding to 0x8000 ~ 0x7FFF).

**Abbreviations**

ADC: Analog Digital Convertor  
BEMF: Back Electromotive Force  
BLDC: Brushless Direct Current  
CRC: Cyclic Redundancy Check  
DAC: Digital Analog Convertor  
DMA: Direct Memory Access  
FG: Frequency Generator  
FICE: Fortior Interactive Connectivity Establishment  
FOC: Field Oriented Control  
FOSC: Fast Oscillator  
GPIO: General Purpose Input Output  
I<sup>2</sup>C: Inter Integrated Circuit  
IC: Integrated Circuit  
IRAM: Internal RAM  
IDE: Integrated Development Environment  
LDO: Low Dropout Regulator  
LPF: Low Pass Filter  
LVD: Low Voltage Detection  
MDU: Multiplication Division Unit  
ME: Motor Engine  
MSB: Most Significant Bit  
MOSFET: Metal Oxide Semiconductor Field Effect Transistor  
NC: Not Connected  
PGA: Programmable Gain Amplifier  
PI/PID: Proportional Integral/Proportional Integral Derivative  
PLL: Phase Locked Loop  
PWM: Pulse Width Modulation  
QEP: Quadrature Encoder Pulse  
RAM: Random Access Memory  
RMW: Read Modified Write  
ROM: Read Only Memory  
RSD: Rotating State Detection  
RTC: Real Time Clock

SCL: Serial Clock Line

SDA: Serial Data Line

SFR: Special Function Register

SMO: Sliding Mode Observer

SOSC: Slow Oscillator

SVPWM: Space Vector PWM

TSD: Temperature Sensor Detect

UART: Universal Asynchronous Receiver/Transmitter

WDT: Watch Dog Timer

XRAM: External RAM

XSFR: External SFR

## 1 System Introduction

### 1.1 Features

- Power supply:
  - External power supply 5V ~ 28V is connected to VCC pin, and internal LDO supplies VDD5 voltage
- MOSFET:
  - P-Channel:
    - $V_{DS} = -40V$
    - $I_D = -5A$
    - $R_{DS} = 25m\Omega$
  - N-Channel:
    - $V_{DS} = 40V$
    - $I_D = 5A$
    - $R_{DS} = 15m\Omega$
- Dual-core: 8051 and ME core
- An instruction cycle mostly takes 1 or 2 system clock cycle(s)
- 16kB Flash ROM, CRC, self-programming, and code protection
- 256 bytes IRAM and 768 bytes XRAM
- ME: Core integrating PID module, FOC module, MDU auxiliary computing module and LPF module
- 16 interrupt sources with 4 configurable priority levels
- GPIO: 25 GPIOs
- Timers:
  - Timer1: Timer supporting square wave drive timing control, automatic commutation, cycle-by-cycle current limiting and Hall/BEMF-based position sensing;
  - Timer2: Timer supporting PWM output, measurement of duty cycle and period of input PWM wave, measurement of the time of set PWM wave numbers, QEP decoding, tailwind/headwind detection (RSD), rotation direction and speed detection of step motor
  - Timer3/Timer4: Timers supporting PWM output, and measurement of duty cycle and period of input PWM wave. Timer4 supports FG generation and Timer3 supports up to 48MHz input.
  - SysTick timer
  - RTC
- Communication interfaces:
  - 1\*I<sup>2</sup>C
  - 2\*UARTs, supporting single-wire mode

- Dual-channel DMA: Support data transmission via I<sup>2</sup>C/UART
- Analog peripherals:
  - 12-bit ADC: 1μs conversion time with internal VREF or external VREF as reference voltage
  - Number of ADC channels: 12
  - Built-in VREF: VDD5
  - Built-in VHALF (VREF/2)
  - 3 standalone operational amplifiers, where AMP0 can be configured as PGA
  - 3-channel analog comparators
  - DAC: Single-channel 9-bit, single channel 6-bit
- FOC module supports single/dual/triple-shunt current sampling
- Oscillator:
  - Built-in 24MHz high-speed RC oscillator
  - Built-in 32.8kHz low-speed RC oscillator
- WDT
- LVD
- TSD
- Two-wire FICE protocol based in-circuit emulation

## 1.2 Applications

The chip can be used for the drive of sensorless/sensored BLDC motors, three-phase/single-phase induction motors and servo motors.

Applications: Ceiling fans, floor fans, vacuum cleaners, low-voltage hair dryers, low-voltage fans, water pumps, ventilators, air purifiers, drones, etc.

## 1.3 Overview

ES9650 is an Intelligent Power Module (IPM) that contains dual cores, controller, drive and power devices in a package. The high-performance motor drive chip incorporates ME core and 8051 core. ME core integrates FOC, MDU, LPF, PID and SVPWM modules which allow for automatic calculation of FOC or square wave control by hardware used for sensed/sensorless BLDC motors. 8051 core is used for parameter configuration and routine processing. Most of 8051 core instruction cycle takes 1 or 2 clock cycle(s). The dual cores work in parallel to achieve high-performance motor control. The chip integrates high-speed operational amplifiers, comparators, high-speed ADC, CRC, I<sup>2</sup>C, UART, Timers and high-speed LDO, which are essential for FOC or square wave control based BLDC motors.

Package of ES9650 is QHFBP8080-60L.

**1.4 Functional Block Diagram**

**1.4.1 ES9650**

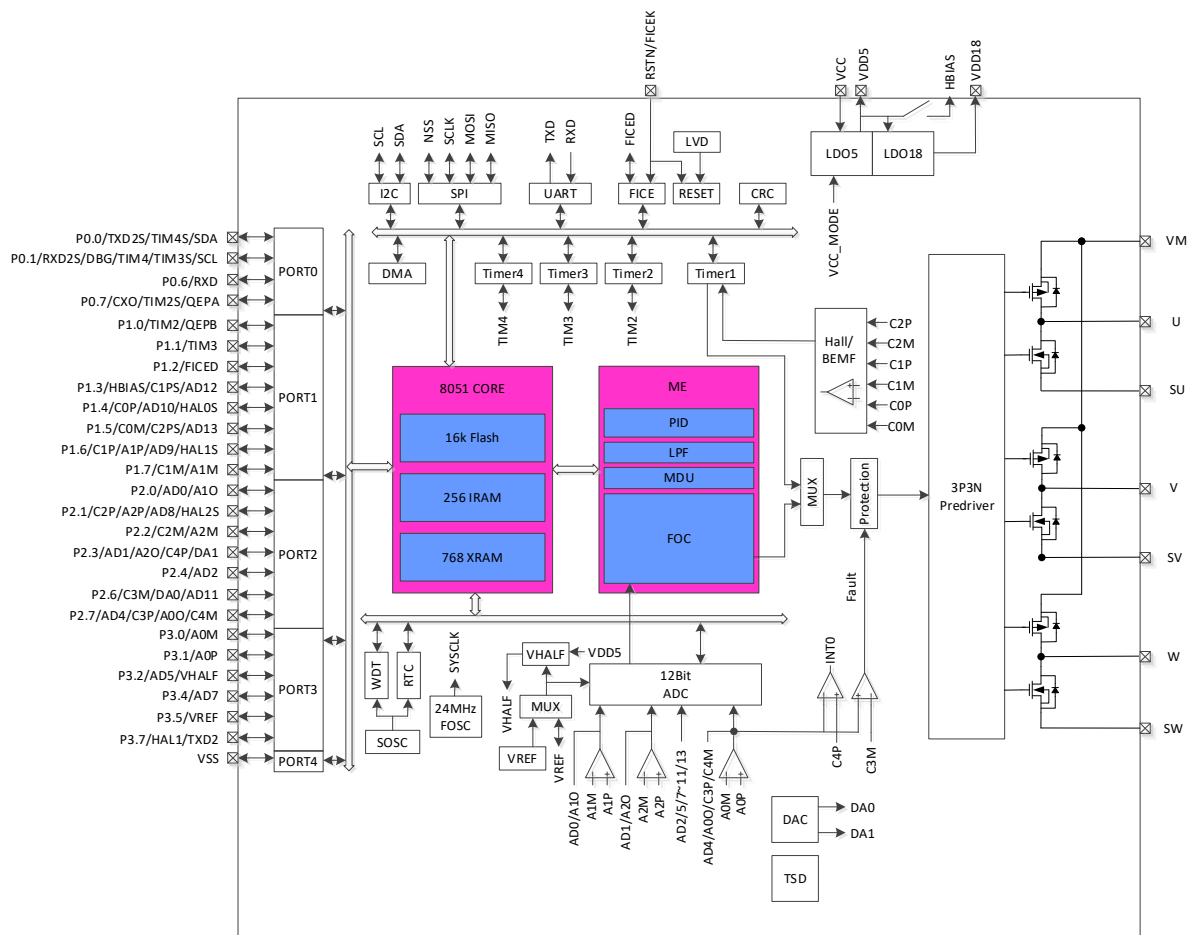

Figure 1-1 ES9650 Functional Block Diagram

## 1.5 Memory Organization

The internal storage space is divided into Program Memory and Data Memory, which are independently addressed.

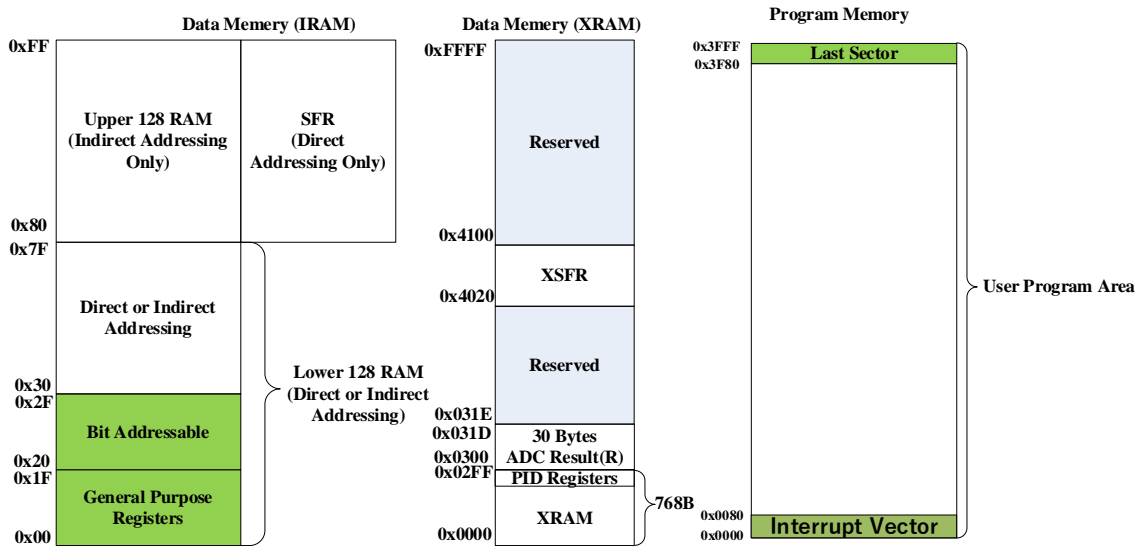

Figure 1-2 Memory Organization

### 1.5.1 Program Memory

The chip implements this program memory as Flash memory with a block from addresses 0x0000 to 0x3FFF to store the control program.

The first sector (0x0000 ~ 0x007F) is the interrupt vector address area, which is used to store the start address of each interrupt subroutine. The last sector (0x3F80 ~ 0x3FFF) contains internal control bits of the chip.

### 1.5.2 Data Memory

The data memory is divided into External Data Memory and Internal Data Memory, as shown in Figure 1-2.

The External Data Memory is addressed in the range from 0x0000 to 0xFFFF, which can be accessed only with MOVX instructions. It comprises XRAM (0x0000 ~ 0x02A7), extended control register space (0x02A8 ~ 0x02EF, 0x4020 ~ 0x40FF) and ADC result memory area (0x0300 ~ 0x031D).

The Internal Data Memory is addressed from 0x00 to 0xFF. Locations 0x00 ~ 0x1F are addressable as 4 banks of general purpose registers, each bank consisting of 8 registers, adding up to 32 registers. Locations 0x20 ~ 0x7F are used for general purpose RAM memory, supporting direct and indirect addressing. Locations 0x20 ~ 0x2F are 16-bit addressable. When locations 0x20 ~ 0x2F are accessed by indirect addressing, it points to RAM. When locations 0x80 ~ 0xFF are accessed by direct addressing, it points to SFR.

**1.5.3 SFR**

Table 1-1 SFR Address Mapping

Addr	0(8)	1(9)	2(A)	3(B)	4(C)	5(D)	6(E)	7(F)

0x88	TCON	UT2_DR	UT2_CR					
0x80	P0	SP	DPL	DPH	FLA_KEY	FLA_CR		PCON

**Notes:**

- Registers containing the symbol “\_” are 16-bit snapshot registers. Snapshot registers are the dynamic registers which shall be read using variables. The value will be incorrect when the register is read directly.
- 8-bit MCU shall read a 16-bit register twice to get the value, the 8 high bits and the 8 low bits respectively. The result will be incorrect when 8 low bits of the register change after MCU has read the 8 high bits. Therefore, when 8 high bits of the snapshot register are read by MCU, the corresponding 8 low bits are stored and read.
- Snapshot register must be read as a whole, the 8 high bits first and then the 8 low bits.

**Notes:**

- Registers containing the symbol “\_” are 16-bit snapshot registers. Snapshot registers are the dynamic registers which shall be read using variables. The value will be incorrect when the register is read directly.
- 8-bit MCU shall read a 16-bit register twice to get the value, the 8 high bits and the 8 low bits respectively. The result will be incorrect when 8 low bits of the register change after MCU has read the 8 high bits. Therefore, when 8 high bits of the snapshot register are read by MCU, the corresponding 8 low bits are stored and read.
- Snapshot register must be read as a whole, the 8 high bits first and then the 8 low bits.

## 2 Pin Definitions

The IO types are defined as below:

- DI = Digital Input
- DO = Digital Output
- DB = Digital Bidirectional
- AI = Analogue Input
- AO = Analogue Output
- AB = Analogue Bidirectional
- P = Power Supply

### 2.1 ES9650 QHFBP8080-60L Pins

Table 2-1 ES9650 QHFBP8080-60L Pins

Pin	ES9650	IO Type	Description
P0.0/ TIM4S TXD2S/ SDA	1	DB/ DB/ DO/ DB	GPIO, configurable as INT0 input Timer4 input/output after function switching UART2 TXD output after function switching I <sup>2</sup> C SDA, configured as collector open-drain output with configurable 4.7K pull-up resistor
P0.1/ RXD2S/  DBG/ TIM4/ TIM3S/ SCL	2	DB/ DB/  DO/ DB/ DB/ DB	GPIO, configurable as INT0 input UART2 RXD input in two-wire mode or TXD output/RXD input in single-wire mode after function switching Debug port Timer4 input or output before function switching Timer3 capture mode input after function switching I <sup>2</sup> C SCL, configured as collector open-drain output with configurable 4.7K pull-up resistor
P0.6/ RXD	3	DB/ DB	GPIO, configurable for pull-up or pull-down input mode UART1 RXD input in two-wire mode or TXD output/RXD input in single-wire mode
P0.7/ CX0/ TIM2S/ QEPA	4	DB/ DO/ DB/ DI	GPIO, configurable for pull-up or pull-down input mode Test port for comparator outputs Timer2 capture mode input or PWM output after function switching Input of QEP A code
P1.0/ TIM2/ QEPB	5	DB/ DB/ DI	GPIO, configurable as INT1 input and pull-up or pull-down input mode Timer2 capture mode input or PWM output before function switching Input of QEP B code
P1.1/ TIM3	6	DB/ DB	GPIO, configurable as INT1 and pull-up or pull-down input mode Timer3 capture mode input before function switching
VSS	7	P	Ground
VM	8	P	MOS power
	9		
	10		
	11		
U	12	DO	U-phase output
	13		
	14		
	15		

Pin	ES9650	IO Type	Description
SU	16	P	U-phase ground
	17		
	18		
	19		
V	20	DO	V-phase output
	21		
	22		
SV	23	P	V-phase ground
	24		
	25		
SW	26	P	W-phase ground
	27		
	28		
W	29	DO	W-phase output
	30		
	31		
	32		
VM	33	P	MOS power
	34		
	35		
	36		
VCC	37	P	Power supply, with an external filter capacitor of 10 $\mu$ F or above. When VCC_MODE = 0, external power supply 5V ~ 28V is connected to VCC pin, and the internal LDO supplies VDD5 voltage.
VSS	38	P	Ground
VDD5	39	P	Output of the internal 5V LDO with a 1 $\mu$ F ~ 4.7 $\mu$ F external capacitor.
RSTN/ FICEK	40	DI/ DI	Input of external reset, with built-in pull-up resistor, Schmitt-trigger input FICE SCL
VDD18	41	P	Output of 1.8V LDO, with a 1 $\mu$ F ~ 4.7 $\mu$ F external capacitor
P1.2/ FICED	42	DB/ DB	GPIO, configurable as INT1 input FICE SDA
P1.3/ HBIAS/ C1PS/ AD12	43	DB/ DO/ AI/ AI	GPIO Hall bias power supply, internally connected to VDD5 via a switch CMP1 positive input after function switching Input of ADC channel 12
P1.4/ COP/ AD10/ HAL0S	44	DB/ AI/ AI/ DI	GPIO, configurable as INT1 CMP0 positive input Input of ADC channel 10 Digital input of Hall0 after function switching
P1.5/ C0M/ C2PS/ AD13	45	DB/ AI/ AI/ AI	GPIO, configurable as INT1 CMP0 negative input CMP2 positive input after function switching Input of ADC channel 13
P1.6/ C1P/ A1P/ AD9/ HAL1S	46	DB/ AI/ AI/ AI/ DI	GPIO, configurable as INT1 CMP1 positive input AMP1 positive input Input of ADC channel 9 Digital input of Hall1 after function switching

Pin	ES9650	IO Type	Description
P1.7/ C1M/ A1M	47	DB/ AI/ AI	GPIO, configurable as INT1 CMP1 negative input AMP1 negative input
P2.0/ AD0/ A1O	48	DB/ AI/ AO	GPIO, configurable as INT1 Input of ADC channel 0 AMP1 output
P2.1/ C2P/ A2P/ AD8/ HAL2S	49	DB/ AI/ AI/ AI/ DI	GPIO, configurable as INT1 CMP2 positive input AMP2 positive input Input of ADC channel 8 Digital input of Hall1 after function switching
P2.2/ C2M/ A2M	50	DB/ AI/ AI	GPIO, configure GPIO1 as INT1 CMP2 negative input AMP2 negative input
P2.3/ AD1/ A2O/ C4P/ DA1	51	DB/ AI/ AO/ AI/ DO	GPIO, configurable as INT1 Input of ADC channel 1 AMP2 output CMP4 negative input DAC1 output, without Buffer output
P2.4/ AD2	52	DB/ AI	GPIO, configurable as INT1 Input of ADC channel 2 for bus voltage signal input
P2.6/ C3M/ DA0/ AD11	53	DB/ AI/ AO/ AI	GPIO, configurable as INT1 CMP3 negative input DAC0 output, without Buffer output Input of ADC channel 11
P2.7/ AD4/ C3P/ A0O/ C4M	54	DB/ AI/ AI/ AO/ AI	GPIO, configurable as INT1 Input of ADC channel 4 for bus current sampling CMP3 positive input AMP0 output CMP4 negative input
P3.0/ A0M	55	DB/ AI	GPIO AMP0 negative input
P3.1/ A0P	56	DB/ AI	GPIO AMP0 positive input
P3.2/ AD5/ VHALF	57	DB/ AI/ AO	GPIO ADC channel 5 input Output of VREF/2 voltage, with a 1 $\mu$ F external capacitor
P3.4/ AD7	58	DB/ AI	GPIO Input of ADC channel 7
P3.5/ VREF	59	DB/ AI	GPIO ADC external VREF input or internal VREF output, with a 1 $\mu$ F external capacitor
P3.7/ HAL1/ TXD2	60	DB/ DI/ DO	GPIO Digital input of Hall1 UART2 TXD output

## 5 Electrical Characteristics

### 5.1 Absolute Maximum Ratings

Table 5-1 Absolute Maximum Ratings

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Operating Ambient Temperature $T_A$		-40	-	85	°C
Operating Ambient Temperature $T_A$		-40	-	85	°C
Operating Junction Temperature $T_J$		-40	-	150	°C
Storage Temperature		-55	-	150	°C
VCC to VSS Voltage		-0.3	-	36	V
VDD5 to VSS Voltage		-0.3	-	6.5	V
RSTN/GPIO to VSS Voltage		-0.3	-	VDD5 + 0.3	V

Notes: Stress values greater than the "Absolute Maximum Ratings" listed in Table 5-1 may cause irreparable damages to the device. These are stress ratings only, and it is NOT recommended to use your device in conditions that go beyond these stress ratings. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

### 5.2 Global Electrical Characteristics

Table 5-2 Global Electrical Characteristics

( $T_A = 25^\circ\text{C}$  and  $V_{CC} = 5\text{V} \sim 28\text{V}$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
VCC Operating Voltage <sup>[1]</sup>	High-voltage Single-power Supply Mode	5	-	28	V
I <sub>VCC</sub> Operating Current <sup>[2]</sup>		-	20	40	mA
I <sub>VCC</sub> Standby Current <sup>[2]</sup>		-	6	12	mA
I <sub>VCC</sub> Sleep-mode Current		-	50	150	μA

Notes:

[1] VCC voltage rise rate ranges from  $0.5\text{V}/\mu\text{s} \sim 0.1\text{V}/\text{s}$  depending on samples batches.

[2] Characteristics may vary with different configurations

### 5.3 GPIO Electrical Characteristics

Table 5-3 GPIO Electrical Characteristics

 ( $T_A = 25^\circ\text{C}$  and  $V_{CC} = 5\text{V} \sim 28\text{V}$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Output Rise Time	50pF load, from 10% to 90% at $T_A = 25^\circ\text{C}$	-	15	-	ns
Output Fall Time	50pF load, from 90% to 10% at $T_A = 25^\circ\text{C}$	-	13	-	ns
$V_{OH}$ Output High Voltage	$I_{OH} = 4\text{mA}$	$V_{DD5} - 0.7$	-	-	V
$V_{OL}$ Output Low Voltage	$I_{OL} = 8\text{mA}$	-	-	$V_{SS} + 0.7$	V
$V_{IH}$ Input High Voltage <sup>[1]</sup>		$0.7 * V_{DD5}$	-	-	V
$V_{IL}$ Input Low Voltage		-	-	$0.2 * V_{DD5}$	V
Pull-up Resistor <sup>[2]</sup>		-	33	-	k $\Omega$
Pull-up Resistor <sup>[3]</sup>		-	5.6	-	k $\Omega$
Pull-down Resistor <sup>[4]</sup>		-	10	-	k $\Omega$

Notes:

 [1] When  $V_{DD5} = 5\text{V}$ , maximum value of  $V_{IH} = 0.6 * V_{DD5}$ 

[2] GPIOs except P0[1:0], P1[6:3], P2[1] and P3[7]

[3] P0[1:0], P1[6:3], P2[1] and P3[7]

[4] P0[1] and P1[1]

### 5.4 ADC Electrical Characteristics

Table 5-4 ADC Electrical Characteristics

 ( $T_A = 25^\circ\text{C}$  and  $V_{CC} = 5\text{V} \sim 28\text{V}$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
INL (Integral Nonlinearity)	12-bit	-	2	-	LSB
DNL (Differential Nonlinearity)	12-bit	-	1.5	-	LSB
OFFSET (Offset Error)	12-bit	-	6	-	LSB
SNR (Signal-to-noise Ratio)	$f_{IN} = 350\text{kHz}$	-	70.8	-	dB
ENOB (Effective Number of Bits)	$f_{IN} = 350\text{kHz}$	-	10.5	-	Bit
SFDR (Spurious-free Dynamic Range)	$f_{IN} = 350\text{kHz}$	-	68.2	-	dB
THD (Total Harmonic Distortion)	$f_{IN} = 350\text{kHz}$	-	67	-	dB
$R_{IN}$ Input Resistance		-	800	-	$\Omega$
$C_{IN}$ Input Capacitance		-	30	-	pF
Conversion Time		-	13	-	ADCLK <sup>[1]</sup>
Sampling Time		3	-	63	ADCLK <sup>[1]</sup>

Note:

[1] ADCLK = 12MHz

## 5.5 VREF Electrical Characteristics

Table 5-5 VREF Electrical Characteristics

 ( $T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$  and  $V_{CC} = 5\text{V} \sim 28\text{V}$ )

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
VREF	VREF_CR[VREFVSEL] = 00	4.3	4.5	4.7	V
VHALF		VREF/2 - 0.2	VREF/2	VREF/2 + 0.2	V

## 5.6 Operational Amplifier Electrical Characteristics

Table 5-6 Operational Amplifier Electrical Characteristics

 ( $T_A = 25^{\circ}\text{C}$  and  $V_{CC} = 5\text{V} \sim 28\text{V}$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
V <sub>ICMR</sub> Common-mode Input Voltage Range		0	-	VDD5 - 1.5	V
V <sub>OS</sub> Operational Amplifier Offset Voltage	$T_A = 25^{\circ}\text{C}$	-	5	10	mV
A <sub>OL</sub> Open-loop Gain	$R_L = 100\text{k}\Omega$	-	80	-	dB
Unity-gain Bandwidth (UGBW)	$C_L = 40\text{pF}$	6	10	-	MHz
Slew Rate (SR)	$C_L = 40\text{pF}$	10	15	-	V/ $\mu\text{s}$
Operational Amplifier Gain <sup>[1]</sup>	AMP_CR1[AMP0_GAIN] = 001	1.88	2	2.12	-
	AMP_CR1[AMP0_GAIN] = 010	3.76	4	4.24	-
	AMP_CR1[AMP0_GAIN] = 011	7.52	8	8.48	-
	AMP_CR1[AMP0_GAIN] = 100	15.04	16	16.96	-

Note:

[1] The operational amplifier gain is measured when both positive and negative terminals of the operational amplifier are connected in series with 1k Ohm resistors. The operational amplifier gain varies with external resistors.

## 5.7 BEMF Electrical Characteristics

Table 5-7 BEMF Electrical Characteristics

 ( $T_A = 25^{\circ}\text{C}$ ,  $V_{CC} = 5\text{V} \sim 28\text{V}$  and  $V_{CC\_MODE} = 0$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
BEMF Built-in Resistor		5.4	6.8	8.2	k $\Omega$
Relative Accuracy between BEMF Built-in Resistors		-	1	-	%

## 5.8 OSC Electrical Characteristics

Table 5-8 OSC Electrical Characteristics

( $T_A = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$ ,  $V_{CC} = 5\text{V} \sim 28\text{V}$  and  $V_{CC\_MODE} = 0$ )

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
System Clock Rate		23.5	24	24.5	MHz
Low-speed Clock Rate		29	32.8	37	kHz

Note: SYSCLK refers to system clock rate, and T to system clock cycle. Unless otherwise specified, the system clock rate of chip is 24MHz and  $T = 1/\text{SYSCLK}$ .

## 5.9 Reset Electrical Characteristics

Table 5-9 Reset Electrical Characteristics

( $T_A = 25^{\circ}\text{C}$ ,  $V_{CC} = 5\text{V} \sim 28\text{V}$  and  $V_{CC\_MODE} = 0$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Minimum Time for RSTN Released to Low		50	-	-	$\mu\text{s}$
VDD5 Reset Threshold	Reset Voltage LVR= 3.0V	2.8	3.0	3.2	V

## 5.10 LDO Electrical Characteristics

Table 5-10 LDO Electrical Characteristics

( $T_A = 25^{\circ}\text{C}$ ,  $V_{CC} = 5\text{V} \sim 28\text{V}$  and  $V_{CC\_MODE} = 0$  unless otherwise specified)

Parameter	Test Conditions	Min.	Typ.	Max.	Unit
VDD5 Voltage	$V_{CC} = 7\text{V} \sim 28\text{V}$ , $V_{CC\_MODE} = 0$	4.7	5	5.3	V
VDD18 Voltage		1.65	1.85	2.0	V

## 5.11 Package Thermal Resistance

Table 5-11 Package Thermal Resistance

Parameter	Test Conditions	Value	Unit
Junction-to-ambient Temperature Thermal Resistance $\theta_{JA}^{[1]}$	JEDEC standard, 2S2P PCB	23.8	$^{\circ}\text{C}/\text{W}$
Junction-to-case Temperature Thermal Resistance $\theta_{JC}^{[1]}$	JEDEC standard, 1S0P PCB	8.1	$^{\circ}\text{C}/\text{W}$

Note:

[1] The actual measurements may vary depending on the conditions.

## 6 Reset Control

### 6.1 Reset Sources (RST\_SR)

The chip includes a reset circuitry with 7 reset sources:

- Power on reset (RSTPOW)
- External reset (RSTEXT)
- Low voltage detector reset (RSTLVD)
- Watchdog timer reset (RSTWDT)
- Flash error detector reset (RSTFED)
- Debug reset (RSTDBG)
- Soft reset (SOFTR)

Reset flag bits can be searched from register RST\_SR. Following the last reset, the affected reset flag is set to “1” and all other reset flags are cleared to “0”. To clear a reset flag, you can set RST\_SR[RSTCLR] to “1” so that RST\_SR[7:3] & RST\_SR[0] are cleared. After reset, MCU restarts the program from address 0.

### 6.2 Reset Enable

See the corresponding control registers.

### 6.3 External Reset and Power-on Reset

The chip resets when RSTN pin remains low for 50 $\mu$ s.

The chip resets when the chip is powered on and VDD5 settles above the reset voltage threshold  $V_{RST}$ .

### 6.4 Low Voltage Detector Reset

The chip’s internal circuitry monitors VDD. When VDD drops to a level below  $V_{RST}$ , the internal monitor circuitry sends a LVD reset signal to reset the chip.

Configuring corresponding register enables VDD monitor circuitry and sets  $V_{RST}$ .

### 6.5 Watchdog Timer Reset

After the watchdog timer (WDT) is enabled, the software periodically writes 1 to WDT\_CR[WDTRF] which initializes watchdog up counter. When watchdog up counter reaches its maximum value, WDT generates an output pulse to reset the chip, which ensures the software runs normally.

### 6.6 Flash Error Detector Reset

The Flash memory can be programmed by software using the MOVX instruction for read/write/erase operations. A Flash error detector reset (RSTFED) occurs if a Flash erase is attempted targeting the last sector (0x3F80 ~ 0x3FFF) or a Flash write is attempted targeting the last byte (0x3FFF). RSTFED is always enabled and cannot be disabled.

## 6.7 Debug Reset

Click **Reset** button of IDE to send a Debug reset signal when the chip enters the debug state.

## 6.8 Soft Reset

The chip resets immediately when RST\_SR[SOFTR] is set to 1. After reset, the flag RST\_SR[SOFTR] is set to “1”.

## 6.9 Reset Registers

### 6.9.1 RST\_SR (0xC9)

Bit	7	6	5	4	3	2	1	0
Name	RSTPOW/ RSTCLR	RSTEXT	RSTLVD	RSV	RSTWDT	RSTFED	RSTDBG	SOFTR
Type	R/W1	R	R	—	R	R	R	R/W1
Reset	—	—	—	—	—	—	—	—
Bit	Name	Description						
[7]	RSTPOW/ RSTCLR	Power-on Reset Flag Read: 0: Last reset was not a power on reset. 1: Last reset was a power on reset. Write: 0: No effect 1: RST_SR[7:3] & RST_SR[0] are cleared to 0.						
[6]	RSTEXT	External RST Pin Reset flag 0: Last reset was not an RST pin reset. 1: Last reset was an RST reset.						
[5]	RSTLVD	Low Voltage Detection (LVD) Reset Flag 0: Last reset was not an LVD reset 1: Last reset was an LVD reset

## 7 Interrupt

### 7.1 Interrupt Introduction

The chip supports 16 interrupt sources. Each interrupt source can be individually programmed in IP0~IP3 registers with one of four priority levels. Interrupt flags are located in an SFR or XSFR. The corresponding interrupt flag is set by the hardware to 1 when the internal circuitry or an external signal meets the interrupt conditions. If IE[EA] = 1 and both the associated interrupt EA and IF bits are set to 1, an interrupt request is sent to CPU. If no other interrupt service routine (ISR) of greater priority is currently being serviced, the system enters interrupt state to service the requesting ISR.

Each interrupt source except the Reset Interrupt can be assigned a priority level. A low priority interrupt can be preempted by a high priority interrupt. The low priority interrupt will not be serviced until the ISR for the high priority interrupt completes. An interrupt will not be preempted by another of the same priority level. Each interrupt source can be individually configured to one of four priority levels in the Interrupt Priority (IP) register. Priority level assigned ascends from 0 to 3 and is defaulted to 0. If two interrupt requests are generated at the same time, the interrupt with the higher priority is serviced first. If two interrupt sources have the same priority, a fixed priority order is used to arbitrate. See Table 7-1 for the interrupt sources and default priority orders, where the lower the mark the higher the priority level.

### 7.2 Interrupt Enable

IE[EA] is the global interrupt enable bit. When IE[EA] = 0, the system does not respond to any interrupt request.

Each interrupt can be individually enabled or disabled by configuring the corresponding interrupt enable bit in an SFR or XSFR. When the enable bit of the global interrupt or an interrupt is cleared, the interrupt flag that is set to 1 is held in a pending state. The MCU will immediately enter the interrupt subroutine once the enable bit is set to 1. Therefore, make sure to clear corresponding interrupt flag bit before enabling the interrupt.

### 7.3 External Interrupt

The external interrupt has 2 interrupt sources: INT0 and INT1.

The digital input signals from P0.0~P0.1 and P0.6~P0.7 and the output signals from CMP4 can be used to trigger INT0. The interrupt source is selected through LVSR[EXT0CFG] bit.

These interrupt sources share one interrupt entry, one interrupt flag bit TCON[IF0] and one interrupt enable bit IE[EX0]. TCON[IT0] bit selects the interrupt edge. IP0[PX0] bit configures the priority level.

The digital input signals from P1.0~1.7, P2.0~P2.4 and P2.6~P2.7 can be used to trigger INT1. P1IF and P2IF are interrupt flag bits, and P1IE and P2IE are interrupt enable bits. Each trigger source has a corresponding interrupt flag bit and an interrupt enable bit. INT1 can select multiple trigger sources that are recognized by P1IF and P2IF in the interrupt subroutine. These 16 interrupt sources share one interrupt entry and one interrupt enable bit IE[EX1]. To enable INT1, first set IE[EX1] to 1 and then configure the corresponding enable bit. The interrupt edge is configured by TCON[IT1] bit, and the priority level by IP0[PX1] bit. See section 7.5.7 P1\_IE (0xD1)~ section 7.5.10 P2\_IF (0xD4)

for INT1 flag registers and enable registers.

## 7.4 Interrupt Summary

Table 7-1 Interrupt Summary

Interrupt Source	Priority Order	Vector Address	Interrupt Flag	Cleared by Software?	Interrupt Enable Bit	Priority Control
Reset	Highest	0x0000	None	N	Always Enable	Highest
LVW Interrupt TSD Interrupt	0	0x0003	LVSR[0] TCON[5]	Y	CCFG1[6] IE[1]	IP0[1:0]
INT0	1	0x000B	TCON[2]	Y	IE[0]	IP0[3:2]
INT1	2	0x0013	P1IF[7:0] P2IF[7:0]	Y	IE[2]	IP0[5:4]
FG Interrupt DRV Compare Match Interrupt	3	0x001B	DRV_SR[5:4]	Y	DRV_SR[3] DRV_SR[2:0]	IP0[7:6]
Timer2 Interrupt	4	0x0023	TIM2_CR1[7:5]	Y	TIM2_CR1[4:3] TIM2_CR0[3]	IP1[1:0]
Timer1 Interrupt	5	0x002B	TIM1_SR[4:0]	Y	TIM1_IER[4:0]	IP1[3:2]
ADC Interrupt	6	0x0033	ADC_CR[0]	Y	ADC_CR[1]	IP1[5:4]
CMP0/1/2 Interrupt	7	0x003B	CMP_SR[6:4]	Y	CMP_CR0[5:0]	IP1[7:6]
RTC Interrupt	8	0x0043	RTC_STA[6]	Y	IE[6]	IP2[1:0]
Timer3 Interrupt	9	0x004B	TIM3_CR1[7:5]	Y	TIM3_CR1[4:3] TIM3_CR0[3]	IP2[3:2]
Systick Interrupt	10	0x0053	DRV_SR[7]	Y	DRV_SR[6]	IP2[5:4]
Timer4 Interrupt	11	0x005B	TIM4_CR1[7:5]	Y	TIM4_CR1[4:3] TIM4_CR0[3]	IP2[7:6]
CMP3 Interrupt	12	0x0063	CMP_SR[7]	Y	CMP_CR0[7:6]	IP3[1:0]
I <sup>2</sup> C Interrupt UART1 Interrupt	13	0x006B	I2C_SR[0] UT_CR[1:0]	Y	I2C_CR[0] IE[4]	IP3[3:2]
UART2 Interrupt	14	0x0073	UT2_CR[1:0]	Y	IE[3] UT2_BAUDH[5]	IP3[5:4]
DMA Interrupt	15	0x007B	DMA0_CR0[0] DMA1_CR0[0]	Y	DMA0_CR0[2]	IP3[7:6]

Notes:

- UT\_CR[RI], UT\_CR[TI], DMA0\_CR0[DMAIF] and DMA0\_CR1[DMAIF] bits can be cleared to “0” or set by software to “1”; and MCU generates an interrupt request when these flags are set to 1. Other flags can only be cleared to “0” by software, and setting them to “1” has no effect.
- For registers containing several interrupt flags, you can write a “1” to the active interrupt flags in order to prevent clearing a interrupt flag to 0. For example, use code `DRV_SR = (DRV_SR & 0x7F) | 0x30` to clear DRV\_SR[SYSTIF].

## 7.5 Interrupt Registers

### 7.5.1 IE (0xA8)

Bit	7	6	5	4	3	2	1	0
Name	EA	RTCIE	RSV	ES0	RSV	EX1	TSDIE	EX0
Type	R/W	R/W	—	R/W	—	R/W	R/W	R/W
Reset	0	0	—	0	—	0	0	0
Bit	Name	Description						
[7]	EA	Enable All Interrupts 0: Disable 1: Enable						
[6]	RTCIE	RTC Interrupt Enable 0: Disable 1: Enable						
[5]	RSV	Reserved						
[4]	ES0	UART1 Interrupt Enable 0: Disable 1: Enable						
[3]	RSV	Reserved						
[2]	EX1	INT1 Interrupt Enable 0: Disable 1: Enable						
[1]	TSDIE	TSD Interrupt Enable 0: Disable 1: Enable						
[0]	EX0	INT0 Interrupt Enable 0: Disable 1: Enable						

### 7.5.2 IP0 (0xB8)

Bit	7	6	5	4	3	2	1	0
Name	PDRV		PX1		PX0		PLVW_TSD	
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	PDRV	FG/DRV Comparison Match Interrupt Priority Control						
[5:4]	PX1	INT1 Interrupt Priority Control						
[3:2]	PX0	INT0 Interrupt Priority Control						
[1:0]	PLVW_TSD	LVW/TSD Interrupt Priority Control						

Note: Priority level assigned ascends from 0 to 3, totaling 4 levels

**7.5.3 IP1 (0xC0)**

Bit	7	6	5	4	3	2	1	0
Name	PCMP		PADC		PTIM1		PTIM2	
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	PCMP	CMP0/1/2 Interrupt Priority Control						
[5:4]	PADC	ADC Interrupt Priority Control						
[3:2]	PTIM1	Timer1 Interrupt Priority Control						
[1:0]	PTIM2	Timer2 Interrupt Priority Control						

Note: Priority level assigned ascends from 0 to 3, totaling 4 levels.

**7.5.4 IP2 (0xC8)**

Bit	7	6	5	4	3	2	1	0
Name	PTIM4		PSYSTICK		PTIM3		PRTC	
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	PTIM4	Timer4 Interrupt Priority Control						
[5:4]	PSYSTICK	Systick Interrupt Priority Control						
[3:2]	PTIM3	Timer3 Interrupt Priority Control						
[1:0]	PRTC	RTC Interrupt Priority Control						

Note: Priority level assigned ascends from 0 to 3, totaling 4 levels.

**7.5.5 IP3 (0xD8)**

Bit	7	6	5	4	3	2	1	0
Name	PDMA		PUT2		PI2C_UT1		PCMP3	
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	PDMA	DMA Interrupt Priority Control						
[5:4]	PUT2	UART2 Interrupt Priority Control						
[3:2]	PI2C_UT1	I <sup>2</sup> C/UART1 Interrupt Priority Control						
[1:0]	PCMP3	CMP3 Interrupt Priority Control						

Note: Priority level assigned ascends from 0 to 3, totaling 4 levels.

**7.5.6 TCON (0x88)**

Bit	7	6	5	4	3	2	1	0
Name	RSV		TSDIF	IT1		IF0	IT0	
Type	—	—	R/W0	R/W	R/W	R/W0	R/W	R/W
Reset	—	—	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	RSV	Reserved						
[5]	TSDIF	TSD Interrupt Flag This bit is set by hardware to 1 when an over-temperature event occurs. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect  Note: This flag is often used with the overtemperature status bit LVSR[TSDIF]						
[4:3]	IT1	INT1 Trigger Level Selection 00: Interrupt on rising edge 01: Interrupt on falling edge 1X: Interrupt on level change (rising or falling)						
[2]	IF0	INT0 Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect						
[1:0]	IT0	INT0 Trigger Level Selection 00: Interrupt on rising edge 01: Interrupt on falling edge 1X: Interrupt on level change (rising or falling)						

**7.5.7 P1\_IE (0xD1)**

Bit	7	6	5	4	3	2	1	0
Name	P17_IE	P16_IE	P15_IE	P14_IE	P13_IE	P12_IE	P11_IE	P10_IE
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	P17_IE	P1.7 INT1 Enable 0: Disable 1: Enable						
[6]	P16_IE	P1.6 INT1 Enable 0: Disable 1: Enable						
[5]	P15_IE	P1.5 INT1 Enable 0: Disable 1: Enable						
[4]	P14_IE	P1.4 INT1 Enable 0: Disable 1: Enable						

[3]	P13_IE	P1.3 INT1 Enable 0: Disable 1: Enable
[2]	P12_IE	P1.2 INT1 Enable 0: Disable 1: Enable
[1]	P11_IE	P1.1 INT1 Enable 0: Disable 1: Enable
[0]	P10_IE	P1.0 INT1 Enable 0: Disable 1: Enable

### 7.5.8 P1\_IF (0xD2)

Bit	7	6	5	4	3	2	1	0
Name	P17_IF	P16_IF	P15_IF	P14_IF	P13_IF	P12_IF	P11_IF	P10_IF
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	P17_IF	P1.7 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[6]	P16_IF	P1.6 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[5]	P15_IF	P1.5 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[4]	P14_IF	P1.4 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[3]	P13_IF	P1.3 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[2]	P12_IF	P1.2 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[1]	P11_IF	P1.1 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						
[0]	P10_IF	P1.0 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending						

Note: The interrupt flag can be cleared to “0” by software.

### 7.5.9 P2\_IE (0xD3)

Bit	7	6	5	4	3	2	1	0
Name	P27_IE	P26_IE	P25_IE	P24_IE	P23_IE	P22_IE	P21_IE	P20_IE
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[6]	P26_IE	P2.6 INT1 Enable 0: Disable 1: Enable
[5]	P25_IE	P2.5 INT1 Enable 0: Disable 1: Enable
[4]	P24_IE	P2.4 INT1 Enable 0: Disable 1: Enable
[3]	P23_IE	P2.3 INT1 Enable 0: Disable 1: Enable
[2]	P22_IE	P2.2 INT1 Enable 0: Disable 1: Enable
[1]	P21_IE	P421 INT1 Enable 0: Disable 1: Enable
[0]	P20_IE	P2.0 INT1 Enable 0: Disable 1: Enable

**7.5.10 P2\_IF (0xD4)**

Bit	7	6	5	4	3	2	1	0
Name	P27_IF	P26_IF	P25_IF	P24_IF	P23_IF	P22_IF	P21_IF	P20_IF
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[7]	P27_IF	P2.7 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[6]	P26_IF	P2.6 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[5]	P25_IF	P2.5 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[4]	P24_IF	P2.4 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[3]	P23_IF	P2.3 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[2]	P22_IF	P2.2 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
[1]	P21_IF	P2.1 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending

---

[0]	P20_IF	P2.0 INT1 Interrupt Flag 0: No Interrupt Pending 1: Interrupt Pending
-----	--------	---

Note: The interrupt flag can be cleared to “0” by software.

## 8 I<sup>2</sup>C

### 8.1 I<sup>2</sup>C Introduction

The I<sup>2</sup>C module provides an industry standard two-wire serial interface and is a simple bi-directional synchronous serial bus for communication between MCU and external I<sup>2</sup>C devices as shown in Figure 8-1. The bus consists of two serial lines: SDA and SCL. P0.0 serves as SDA port and P0.1 as SCL port. P0.0 and P0.1 automatically shifts into open-drain outputs when I<sup>2</sup>C is enabled.

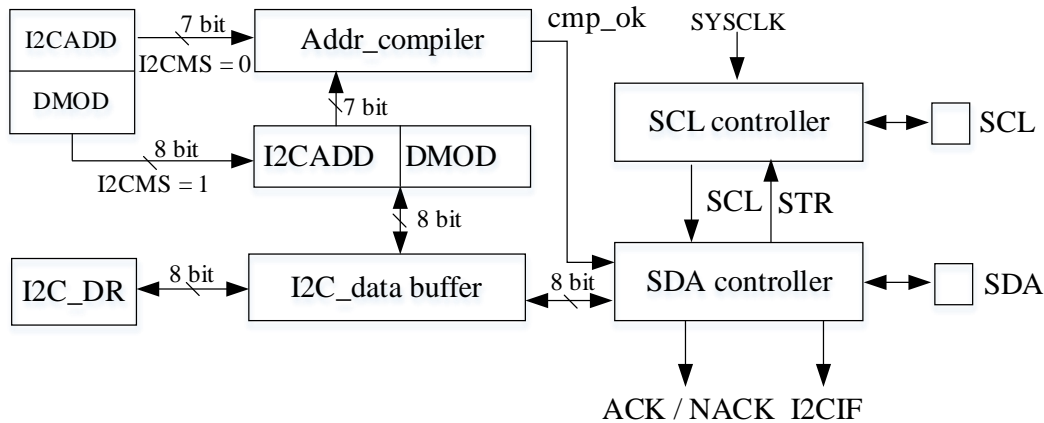

Figure 8-1 I<sup>2</sup>C Block Diagram

Features:

- Support standard mode (up to 100kHz), fast mode (up to 400kHz) and fast plus mode (up to 1MHz)
- Support master mode and slave mode
- Support 7-bit address mode and general call address mode
- Support DMA data transfer

Both SDA and SCL lines are high when the bus is idle, which is the only basis for detecting whether the bus is idle or not. Only one master device and at least one slave device are active on the bus during the transmission. When the bus is occupied, other devices must wait for the bus idle to start an I<sup>2</sup>C communication. The master starts the bus to transfer data. Clock signal is sent to all devices via SCL and the slave address and read/write mode are sent via SDA. When a device on the bus matches the address, it acts as a slave. The relationships between masters and slaves or data transfer direction on the bus are not constant. The process for the master to send data to the slave is shown in Figure 8-2. The master first addresses the slave device and waits for the slave response. And then it sends data to the slave. Finally, the master terminates the data transmission. The process for the master to receive data from the slave is shown in Figure 8-3. The master first addresses the slave and waits for the slave response. And then, it receives the data from the slave. Finally, the master terminates the data transmission. In this case, the master generates the timing clock and stops the data transmission.

Figure 8-2 Master Sends Data to Slave

Figure 8-3 Master Receives Data from Slave

## 8.2 I<sup>2</sup>C Operations

### 8.2.1 Master Mode

1. Set I2C\_CR[I2CMS] to “1” to select master mode;
2. Configure I2C\_CR [I2CSPD] to set the clock rate of SCL;
3. Configure I2C\_ID[I2CADD] to set the slave address;
4. Configure I2C\_SR[DMOD] to set the read/write direction;
5. Set I2C\_CR[I2CEN] to “1”to enable I<sup>2</sup>C;
6. Set I2C\_SR[I2CSTA] to “1” to send START and address. After ACK/NACK is received, I2C\_SR[STR] is set to “1” by hardware and SCL is pulled LOW by the master
7. Data Transmission: Write the data to I2C\_DR register. The master starts to send data after I2C\_SR[STR] is reset and SCL is released. After the data is transmitted and ACK/NACK is received, I2C\_SR[STR] is to “1” by hardware and SCL is pulled to LOW by the master;
8. Data Reception: The master starts to receive data after I2C\_SR[STR] is reset and SCL is released. When the data is received, I2C\_SR[STR] is set to “1” by hardware and SCL is pulled LOW by the master. Configure ACK/NACK via I2C\_SR[NACK], and then clear I2C\_SR[STR] to release SCL to send ACK/NACK signal. After the data is received, I2C\_SR[STR] is set to “1” by hardware and SCL is pulled LOW by the master
9. Stop Communication: Set I2C\_SR[I2CSTP] to “1” when I2C\_SR[STR] is “1”. Stop signal is sent after I2C\_SR[STR] is cleared.

### 8.2.2 Slave Mode

1. Set I2C\_CR[I2CMS] to “0” to select slave mode;
2. Configure I2C\_ID[I2CADD] to set the slave address or set I2C\_ID[GC] to “1” to enable general call mode;
3. Set I2C\_CR[I2CEN] to “1” to enable I<sup>2</sup>C;

4. After START signal and the correct address are received, I2C\_SR[I2CSTA] and I2C\_SR[STR] are set to “1” by hardware and SCL is pulled LOW by the slave. ACK/NACK is configured via I2C\_SR[NACK] and the slave determines whether to receive or send the data via I2C\_SR[DMOD].
5. Data Transmission: Write the data to I2C\_DR register and clear I2C\_SR[STR] to release SCL. The data is sent after ACK/NACK is transmitted. After the data is sent and ACK/NACK is received from the master, I2C\_SR[STR] is set by hardware to “1” and SCL is pulled LOW by the slave
6. Data Reception: Clear I2C\_SR[STR] to release SCL to receive data. After the data is received, I2C\_SR[STR] is set to “1” by hardware and SCL is pulled LOW by the slave. ACK/NACK is configured via I2C\_SR[NACK] to reset I2C\_SR[STR] to release SCL for ACK/NACK transmission. If new data is received, I2C\_SR[STR] is set by hardware to “1” and SCL is pulled LOW by the slave.
7. RESTART: If the slave is processing a service when receiving START signal, it halts the current routine and waits for receiving address.

### 8.2.3 I<sup>2</sup>C Interrupt Sources

The interrupt sources of I<sup>2</sup>C include:

- I2C\_SR[STR] = 1 generates an interrupt. This interrupt source is valid in both master and slave modes.
- I2C\_SR[I2CSTP] = 1 generates an interrupt. This interrupt source is only valid in slave mode.

## 8.3 I<sup>2</sup>C Registers

### 8.3.1 I2C\_CR (0x4028)

Bit	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	I2C_DR	I <sup>2</sup> C Data Register Read: Data to be sent or received Write: Data to be sent						

**8.3.4 I2C\_SR (0x402B)**

Bit	7	6	5	4	3	2	1	0
Name	I2CBSY	DMOD	RSV	I2CSTA	I2CSTP	STR	NACK	I2CIF
Type	R	R/W	—	R/W	R/W	R/W0	R/W	R
Reset	0	0	—	0	0	0	0	0
Bit	Name	Description						
[7]	I2CBSY	I <sup>2</sup> C busy flag I2C_SR[I2CBSY] is cleared to “0” by hardware when I2C_CR[I2CEN] is set to 0. Master mode: This bit is set to “1” by hardware after START is sent, and cleared to “0” by hardware after STOP is sent.  Slave mode: This bit is set to “1” by hardware after START is received and address matches, and cleared to “0” by hardware after STOP is received.						
[6]	DMOD	I <sup>2</sup> C R/W flag 0: WRITE(master sends the data, slave receives the data) 1: READ (master receives the data, slave sends the data)  Note: Read only in slave mode						
[5]	RSV	Reserved						

[4]	I2CSTA	<p>Master mode: When this bit is configured with “1” by the software, START and address bytes are transmitted after both SCL and SDA are HIGH confirmed by the hardware. This bit is cleared to “0” by hardware automatically when the transmission is completed, and I2C_SR[I2CSTA] writing is forbidden during data transmission. After the data is sent or received, I2C_SR[I2CSTA] is set to “1” to transmit RESTART. 0: Not START and address 1: Send START or RESTART and address</p> <p>Slave mode: This bit is set to “1” after hardware receives START and address matches, and cleared to “0” by software.</p> <p>Table 8-1 Relationship between I2C_SR[I2CSTA/I2CSTP] and I<sup>2</sup>C Data Type</p> <table border="1" data-bbox="470 645 1390 837"> <thead> <tr> <th>I2CSTA</th> <th>I2CSTP</th> <th>I<sup>2</sup>C Data Type</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Data byte</td> </tr> <tr> <td>0</td> <td>1</td> <td>STOP</td> </tr> <tr> <td>1</td> <td>0</td> <td>START + address</td> </tr> <tr> <td>1</td> <td>1</td> <td>STOP received first, then START + address bytes</td> </tr> </tbody> </table> <p>Note: When I2C_CR[I2CEN] is “0”, I2C_SR[I2CSTA] is automatically cleared to “0”.</p>	I2CSTA	I2CSTP	I <sup>2</sup> C Data Type	0	0	Data byte	0	1	STOP	1	0	START + address	1	1	STOP received first, then START + address bytes
I2CSTA	I2CSTP	I <sup>2</sup> C Data Type															
0	0	Data byte															
0	1	STOP															
1	0	START + address															
1	1	STOP received first, then START + address bytes															
[3]	I2CSTP	<p>Master mode: This bit cannot be written to “1” by software unless I2C_SR[I2CBSY] = 1. STOP is transmitted after I2C_SR[STR] is cleared to release SCL. After the transmission, this bit is cleared to “0” automatically by hardware. If I2C_SR[I2CSTA] and I2C_SR[I2CSTP] are written to “1” at the same time and I2C_SR[I2CBSY] is “1”, I<sup>2</sup>C first sends STOP, then START and address bytes. After START and address bytes are transmitted, I2C_SR[STR] is set to “1” by hardware. I2C_SR[I2CSTP] writing is forbidden during data transmission. 0: STOP is not transmitted. 1: STOP is transmitted.</p> <p>Slave mode: This bit is set to 1 by hardware after STOP is received, and cleared to “0” by software. Refer to Table 8-1 for status flags</p> <p>Note: When I2C_CR[I2CEN] is 0, I2C_SR[I2CSTP] is automatically cleared to “0” by hardware.</p>															
[2]	STR	<p>I<sup>2</sup>C Bus Pending Flag Master Mode: After START and address or DATA byte are transmitted, I2C_SR[STR] are set to “1” by hardware and SCL is pulled LOW. SCL is released after I2C_SR[STR] is cleared by software. When I2C_SR[I2CSTA] and I2C_SR[I2CSTP] are both “1”, I2C_SR[STR] is set to “1” only after hardware sends STOP and START &amp; address bytes.</p> <p>Slave mode: After DATA byte is received or START receives and address matches, I2C_SR[STR] is set to “1” and SCL is pulled LOW. SCL is released after I2C_SR[STR] is cleared by software.</p> <p>Note: This bit is set to “1” by hardware and cleared to “0” by software. When I2C_SR[I2CEN] = 0, I2C_SR[STR] is automatically cleared to “0”.</p>															
[1]	NACK	<p>This bit refers to the feedback from a receiver to a sender after a byte is transferred via I<sup>2</sup>C. It is automatically cleared to “0” when I2C_SR[I2CEN] = 0. 0: ACK, indicating that the receiver can continue to receive data 1: NACK, indicating that the receiver attempts to stop data transmission When the device is in read mode, I2C_SR[NACK] is configured to send ACK/NACK after the 8<sup>th</sup> bit of data is received.</p>															

		0: Bit9 sends ACK 1: Bit9 sends NACK When the device is in write mode, I2C_SR[NACK] is read to receive ACK/NACK after the 8 <sup>th</sup> bit of data is sent. 0: Bit9 receives ACK 1: Bit9 receives NACK
[0]	I2CIF	I <sup>2</sup> C Interrupt Flag 0: No interrupt pending 1: Interrupt pending In master and slave mode, an interrupt generates when I2C_SR[STR] = 1 In slave mode, an interrupt generates when I2C_SR[I2CSTP] = 1

**9 UART**

**9.1 Introduction**

UART is a full-duplex or half-duplex serial data exchange interface as shown in Figure 9-1. The baud rate is configurable and supports DMA transmission. Figure 9-2 depicts the UART timing.

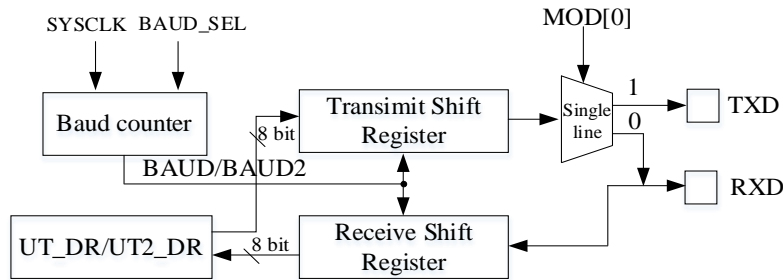

Figure 9-3 UART Block Diagram

Figure 9-4 UART Communication Timing Diagram

**9.2 UART Operations**

**9.2.1 UART1 Operating Instructions**

Relevant registers shall be enabled to implement UART feature. See descriptions on bits [6] and [5] in section 20.3.12 PH\_SEL (0x404C) for details.

**9.2.1.1 UART1 Mode0**

UART1 mode0 works in single-wire half-duplex mode. RXD pin is configured as both an output (Transmit Data Bus) and an input (Receive Data Bus). It uses a total of 10 bits (1-bit start, 8-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT\_BAUD[BAUD].

Data Transmission: Write the data to UT\_DR and clear UT\_CR[TI]. RXD outputs 10-bit data. UT\_CR[TI] is set to “1” after the transmission is completed.

Data Reception: Set UT\_CR[REN] to “1” to receive the data and clear UT\_CR[RI]. The data is received via RXD. After the data is received, UT\_CR[RI] is set to “1” and UT\_DR is read to obtain the data.

**9.2.1.2 UART1 Mode1**

UART1 mode1 works in full/half duplex mode. TXD pin is configured as an output (Transmit Data Bus), and RXD as an input (Receive Data Bus). It uses a total of 10 bits (1-bit start, 8-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT\_BAUD[BAUD].

Data Transmission: Write the data to UT\_DR and clear UT\_CR[TI]. TXD outputs 10-bit data. UT\_CR[TI] is set to “1” after the transmission is completed.

Data Reception: Set UT\_CR[REN] to “1” to receive the data and clear UT\_CR[RI]. The data is received via RXD. After the data is received, UT\_CR[RI] is set to “1” and UT\_DR is read to obtain the data.

### 9.2.1.3 UART1 Mode2

UART1 mode2 works in single-wire half-duplex mode. RXD pin is configured as both an output (Transmit Data Bus) and an input (Receive Data Bus). It uses a total of 11 bits (1 start bit, 9 data bits, and 1 stop bit) to receive or transmit data. The baud rate is configured by UT\_BAUD[BAUD].

Data Transmission: Write the first 8 low bits of the data to UT\_DR and the 9<sup>th</sup> bit to UT\_CR[TB8], and clear UT\_CR[TI]. TXD outputs 11-bit data. UT\_CR[TI] is set to “1” after the transmission is completed.

Data Reception: Set UT\_CR[REN] to “1” to receive the data and clear UT\_CR[RI]. The data is received via RXD. After the data is received, UT\_CR[RI] is set to “1”. UT\_CR[RB8] stores the 9<sup>th</sup> bit of the data, and UT\_DR stores the first 8 low bits.

### 9.2.1.4 UART1 Mode3

UART1 mode3 works in full/half duplex mode. TXD pin is configured as an output (Transmit Data Bus), and RXD as an input (Receive Data Bus). It uses a total of 11 bits (1-bit start, 9-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT\_BAUD[BAUD].

Data Transmission: Write the first 8 low bits of the data to UT\_DR and the 9<sup>th</sup> bit to UT\_CR[TB8], and clear UT\_CR[TI]. TXD outputs 11-bit data. UT\_CR[TI] is set to “1” after the transmission is completed.

Data Reception: Set UT\_CR[REN] to “1” to receive the data and clear UT\_CR[RI]. The data is received via RXD. After the data is received, UT\_CR[RI] is set to “1”. UT\_CR[RB8] stores the 9<sup>th</sup> bit of the data, and UT\_DR stores the first 8 low bits.

### 9.2.1.5 UART1 Interrupt

UART1 interrupt includes:

- After UART1 sends the data, UT\_CR[TI] is set to 1 by hardware
- After UART1 receives the data and STOP, UT\_CR[RI] is set to 1 by hardware

## 9.2.2 UART2 Operating Instructions

### 9.2.2.1 UART2 Mode0

UART2 mode0 works in single-wire half-duplex mode. RXD pin is configured as both an output (Transmit Data Bus) and an input (Receive Data Bus). It uses a total of 10 bits (1-bit start, 8-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT2\_BAUD[BAUD2].

Data Transmission: Write the data to UT2\_DR and clear UT2\_CR[UT2TI]. RXD outputs 10-bit data.

UT2\_CR[UT2TI] is set to “1” after the transmission is completed.

Data Reception: Set UT2\_CR[UT2REN] to “1” to receive the data and clear UT2\_CR[UT2RI]. The data is received via RXD. After the data is received, UT2\_CR[UT2RI] is set to “1” and UT2\_DR is read to obtain the data.

### **9.2.2.2 UART2 Mode1**

UART2 mode1 works in full/half duplex mode. TXD pin is configured as an output (Transmit Data Bus), and RXD as an input (Receive Data Bus). It uses a total of 10 bits (1-bit start, 8-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT2\_BAUD[BAUD2].

Data Transmission: Write the data to UT2\_DR and clear UT2\_CR[UT2TI]. TXD outputs 10-bit data. UT2\_CR[UT2TI] is set to “1” after the transmission is completed.

Data Reception: Set UT2\_CR[UT2REN] to “1” to receive the data and clear UT2\_CR[UT2RI]. The data is received via RXD. After the data is received, UT2\_CR[UT2RI] is set to “1” and UT2\_DR is read to obtain the data.

### **9.2.2.3 UART2 Mode2**

UART2 mode2 works in single-wire half-duplex mode. RXD pin is configured as both an output (Transmit Data Bus) and an input (Receive Data Bus). It uses a total of 11 bits (1 start bit, 9 data bits, and 1 stop bit) to receive or transmit data. The baud rate is configured by UT2\_BAUD[BAUD2].

Data Transmission: Write the first 8 low bits of the data to UT2\_DR and the 9<sup>th</sup> bit to UT2\_CR[UT2TB8], and clear UT2\_CR[UT2TI]. TXD outputs 11-bit data. UT2\_CR[UT2TI] is set to “1” after the transmission is completed.

Data Reception: Set UT2\_CR[UT2REN] to “1” to receive the data and clear UT2\_CR[UT2RI]. The data is received via RXD. After the data is received, UT2\_CR[UT2RI] is set to “1”. UT2\_CR[UT2RB8] stores the 9<sup>th</sup> bit of the data, and UT2\_DR stores the first 8 low bits.

### **9.2.2.4 UART2 Mode3**

UART2 mode3 works in full/half duplex mode. TXD pin is configured as an output (Transmit Data Bus), and RXD as an input (Receive Data Bus). It uses a total of 11 bits (1-bit start, 9-bit data, 1-bit stop) to receive or transmit data. The baud rate is configured by UT2\_BAUD[BAUD2].

Data Transmission: Write the first 8 low bits of the data to UT2\_DR and the 9<sup>th</sup> bit to UT2\_CR[UT2TB8], and clear UT2\_CR[UT2TI]. TXD outputs 11-bit data. UT2\_CR[UT2TI] is set to “1” after the transmission is completed.

Data Reception: Set UT2\_CR[UT2REN] to “1” to receive the data and clear UT2\_CR[UT2RI]. The data is received via RXD. After the data is received, UT2\_CR[UT2RI] is set to “1”. UT2\_CR[UT2RB8] stores the 9<sup>th</sup> bit of the data, and UT2\_DR stores the first 8 low-order bits.

### 9.2.2.5 UART2 Interrupt

UART2 interrupt includes:

- After UART2 sends data, UT2\_CR[UT2TI] is set to “1” by hardware.
- After UART2 receives data and STOP, UT2\_CR[UT2RI] is set to “1” by hardware.

## 9.3 UART1 Registers

### 9.3.1 UT\_CR (0x98)

Bit	7	6	5	4	3	2	1	0
Name	MOD		SM2	REN	TB8	RB8	TI	RI
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	MOD	Mode Selection 00: Mode 0 01: Mode 1 10: Mode 2 11: Mode 3						
[5]	SM2	Communication Mode 0: Single-device communication 1: Multi-device communication						
[4]	REN	Serial input enable 0: Disable 1: Enable						
[3]	TB8	Bit9 of the sent data in mode 2 and mode 3						
[2]	RB8	Bit9 of the received data in mode 2 and mode 3						
[1]	TI	Data Sending Completed Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0”. 1: The interrupt is generated.						
[0]	RI	Data Reception Completed Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0”. 1: The interrupt is generated.						

### 9.3.2 UT\_DR (0x99)

Bit	7	6	5	4	3	2	1	0
Name	UT_DR							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	UT_DR	Send/Receive Data Read: Data received Write: Data to be sent						

		Note: The UART1 data buffer consists of two independent buffers, i.e., a receive buffer and a transmit buffer, which can send and receive data at the same time. The transmit buffer can be written only but not read, while the receive buffer can be read only but not written. Both buffers share a same address.
--	--	--

### 9.3.3 UT\_BAUD (0x9A, 0x9B)

UT_BAUDH(0x9B)								
Bit	15	14	13	12	11	10	9	8
Name	BAUD_SEL	RSV			BAUD[11:8]			
Type	R/W	—	—	—	R/W	R/W	R/W	R/W
Reset	0	—	—	—	0	0	0	0
UT_BAUDL(0x9A)								
Bit	7	6	5	4	3	2	1	0
Name	BAUD[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	1	1	0	1	1
Bit	Name	Description						
[15]	BAUD_SEL	Frequency Multiplier Enable 0: Disable 1: Enable						
[14:12]	RSV	Reserved						
[11:0]	BAUD	Baud Rate Setting Baud rate = $\text{SYSCLK}/(16/(1 + \text{UT\_BAUD}[\text{BAUD\_SEL}]))/(\text{UT\_BAUD}[\text{BAUD}] + 1)$ For example, baud rate = 9600, $\text{UT\_BAUD}[\text{BAUD\_SEL}] = 0$ , $\text{UT\_BAUD}[\text{BAUD}] = (24\text{M}/16/9600/(1 + 0)) - 1 = 155$ (0x9B)						

## 9.4 UART2 Registers

### 9.4.1 UT2\_CR (0x8A)

Bit	7	6	5	4	3	2	1	0
Name	UT2MOD		UT2SM2	UT2REN	UT2TB8	UT2RB8	UT2TI	UT2RI
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W0	R/W0
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	UT2MOD	Mode Selection 00: Mode 0 01: Mode 1 10: Mode 2 11: Mode 3						
[5]	UT2SM2	Communication Mode 0: Single-device communication 1: Multi-device communication						
[4]	UT2REN	Serial Input Enable 0: Disable 1: Enable						
[3]	UT2TB8	Bit9 of the sent data in mode 2 and mode 3						
[2]	UT2RB8	Bit9 of the received data in mode 2 and mode 3						
[1]	UT2TI	Data Sending Completed Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to "0" 1: No effect						
[0]	UT2RI	Data Reception Completed Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to "0" 1: No effect						

### 9.4.2 UT2\_DR (0x89)

Bit	7	6	5	4	3	2	1	0
Name	UT2_DR							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	UT2_DR	Send/Receive Data Read: Data received Write: Data to be sent  Note: The data buffer of UART2 contains two independent receive and send buffers, which can send and receive data at the same time. The send buffer can only be written but not read while the receive buffer can only be read but not written. The two buffers share a same address.						

**9.4.3 UT2\_BAUD (0x4042, 0x4043)**

UT2_BAUDH(0x4042)								
Bit	15	14	13	12	11	10	9	8
Name	BAUD2_SEL	UART2CH	UART2IEN	RSV	BAUD2[11:8]			
Type	R/W	R/W	R/W	—	R/W	R/W	R/W	R/W
Reset	0	0	0	—	0	0	0	0
UT2_BAUDL(0x4043)								
Bit	7	6	5	4	3	2	1	0
Name	BAUD2[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	1	1	0	1	1
Bit	Name	Description						
[15]	BAUD2_SEL	Frequency Multiplier Enable 0: Disable 1: Enable						
[14]	UART2CH	UART2 Function Switching Enable 0: UART2 function switching is disabled, P3.7 as TXD (UART2 for output only) 1: UART2 function switching is enabled, P0.1 as RXD and P0.0 as TXD						
[13]	UART2IEN	UART2 Interrupt Enable 0: Disable 1: Enable						
[12]	RSV	Reserved						
[11:0]	BAUD2	Baud Rate Setting Baud rate = $\text{SYSCLK} / (16 / (1 + \text{UT2\_BAUD}[\text{BAUD\_SEL}])) / (\text{UT2\_BAUD}[\text{BAUD2}] + 1)$ For example, baud rate = 9600, $\text{UT2\_BAUD}[\text{BAUD\_SEL}] = 0$ ; $\text{UT2\_BAUD}[\text{BAUD2}] = (24\text{M} / 16 / 9600 / (1 + 0)) - 1 = 155$ (0x9B)						

## 10 MDU

### 10.1 MDU Introduction

MDU is a computational co-processing unit, which assists the CPU to process complex operations efficiently. MDU provides multiplication, division, trigonometric functions, low-pass filter and PID operation. MDU module can be invoked in different interrupt services and master programs, and the results are independent from each other.

### 10.2 MDU Features

- Support invocation with nested interrupt
- Hardware acceleration to reduce CPU load
- Support the following modes:
  - 16-bit signed multiplication
  - 16-bit signed multiplication (result shifted with one-bit left)
  - 16-bit unsigned multiplication
  - 32-bit/16-bit unsigned division
  - Low-pass filter
  - Coordinate transformation
  - Arctangent

### 10.3 MDU Instructions

#### 10.3.1 MDU Operations

MDU is operated as follows.

1. Set MDU\_CR[MDURUN] to 1;
2. Configure MDU\_MD to select the operation mode;
3. Write data to MDU\_A, MDU\_B, MDU\_C and MDU\_D. The operation starts after MDU\_C[7:0] is written;
4. Wait for MDU\_CR[MDUBUSY] to be cleared by hardware;
5. Set MDU\_CR[MDUDONE] to 1.

Notes:

- Before using MDU, MDU\_CR[MDURUN] must be set to 1. After the operation is completed, MDU\_CR[MDUDONE] must be set to 1. These two steps ensure the data of MDU is not affected by nested calls of different interrupts and the main function.
- Make sure the operation mode and other registers have been written before MDU\_C[7:0] is written.

#### 10.3.2 16-bit Signed Multiplication with the Result Shifted Left by 1 Bit

When MDU\_MD[2:0]=000, MDU module works in 16-bit signed multiplication mode with the result shifted left by 1 bit. As shown in Table 10-1, after 16-bit signed data is written to MDU\_A and MDU\_C as the multiplied number

and multiplier respectively, 32-bit signed data is obtained by the product shifting left by 1 bit. The 16 high-order bits of this data are read by MDU\_A, and the 16 low-order bits are read by MDU\_B.

Table 10-1 Register Definitions in 16-bit Signed Multiplication Mode with the Result Shifted Left by One-bit

Data Register	Input Data	Output Data
MDU_A	Multiplied number	High-order 16 bits of the product
MDU_B	—	Low-order 16 bits of the product
MDU_C	Multiplier	—
MDU_D	—	—

### 10.3.3 16-bit Signed Multiplication

When MDU\_MD[2:0] = 001, MDU module works in 16-bit signed multiplication mode. As shown in Table 10-2, 31-bit signed data is obtained after 16-bit signed data is written to MDU\_A and MDU\_C as the multiplied number and multiplier respectively. The high 16 bits of the data is read by MDU\_A, and the low 16 bits is read by MDU\_B.

Table 10-2 Register Definitions in 16-Bit Signed Multiplication Mode

Data Register	Input Data	Output Data
MDU_A	Multiplied number	High-order 16 bits of the product
MDU_B	—	Low-order 16 bits of the product
MDU_C	Multiplier	—
MDU_D	—	—

### 10.3.4 16-bit Unsigned Multiplication

When MDU\_MD[2:0] = 010, MDU module works in 16-bit unsigned multiplication mode. As shown in Table 10-3, 32-bit unsigned data is obtained after 16-bit unsigned data is written to MDU\_A and MDU\_C as the multiplied number and multiplier respectively. The high 16 bits of the data is read by MDU\_A, and the low 16 bits is read by MDU\_B.

Table 10-3 Meaning of the Register in 16-Bit Unsigned Multiplication Mode

Data Register	Input Data	Output Data
MDU_A	Multiplied number	High-order 16 bits of the product
MDU_B	—	Low-order 16 bits of the product
MDU_C	Multiplier	—
MDU_D	—	—

### 10.3.5 32-bit/16-bit Unsigned Division

When MDU\_MD[2:0] = 011, the MDU works in 32-bit/16-bit unsigned division mode. As shown in Table 10-4, the dividend is 32-bit unsigned data, and the divisor is 16-bit unsigned data. 32-bit unsigned quotient with 16-bit unsigned remainder is obtained after high 16 bits of the dividend is written to MDU\_A, low 16 bits of the dividend is written to MDU\_B, and divisor is written to MDU\_C. The high 16 bits of the quotient is read by MDU\_A, the low 16

bits is read by MDU\_B, and the remainder is read by MDU\_C.

Table 10-4 Meaning of the Register in Unsigned Division Mode

Data Register	Input Data	Output Data
MDU_A	High-order 16 bits of the dividend	High 16 bits of the quotient
MDU_B	Low-order 16 bits of the dividend	Low 16 bits of the quotient
MDU_C	Divisor	Remainder
MDU_D	—	—

### 10.3.6 Low-Pass Filter

When MDU\_MD[2:0] = 110, MDU works in LPF mode.

The calculation formula of LPF is:

$$Y_k = Y_{k-1} + K \times (X_k - Y_{k-1})$$

Where,

$Y_k$ : Filtered value

$Y_{k-1}$ : Previous filtered value

$K$ : Filter coefficient

$X_k$ : Value to be filtered

As shown in Table 10-5,  $Y_k$  and  $Y_{k-1}$  are 32-bit signed data,  $X_k$  is 16-bit signed data, and  $K$  is 8-bit unsigned data.  $Y_k$  is obtained after high 16 bits of  $Y_{k-1}$  is written to MDU\_B, low 16 bits of  $Y_{k-1}$  to MDU\_C,  $K$  to MDU\_D and  $X_k$  to MDU\_A. High 16 bits of  $Y_k$  is read by MDU\_B, and low 16 bits is read by MDU\_C.

Table 10-5 Meaning of the Register in LPF Mode

Data Register	Input Data	Output Data
MDU_A	$X_k$	—
MDU_B	$Y_{k-1}[31:16]$	$Y_k[31:16]$
MDU_C	$Y_{k-1}[15:0]$	$Y_k[15:0]$
MDU_D	$K$	—

### 10.3.7 Coordinate Transformation

When MDU\_MD[2:0] = 100, MDU works in coordinate transformation mode. As shown in Figure 10-1, the coordinate transformation converts the components  $cos_i$  and  $sin_i$  of vector A under the x-y axis to the components  $cos_o$  and  $sin_o$  under the x'-y' axis, with the x'-y' axis lagging the x-y axis by  $\theta$ .

The formula for coordinate transformation is:

$$cos_o = cos_i \times cos \theta - sin_i \times sin \theta$$

$$sin_o = cos_i \times sin \theta + sin_i \times cos \theta$$

In particular, when  $sin_i = 0$ , the coordinate transformation is a sine and cosine calculation with  $cos_i$  as the amplitude,

calculated as:

$$\cos_o = \cos_i \times \cos \theta$$

$$\sin_o = \cos_i \times \sin \theta$$

Figure 10-1 Coordinate Transformation

As shown in Table 10-6,  $\cos_i, \sin_i, \theta, \cos_o$  and  $\sin_o$  are all 16-bit signed data.  $\cos_i$  is written to MDU\_A,  $\theta$  to MDU\_B and  $\sin_i$  to MDU\_C to calculate  $\cos_o$  and  $\sin_o$ .  $\cos_o$  is read by MDU\_A and  $\sin_o$  by MDU\_C.

Table 10-6 Register Definitions in Coordinate Transformation Mode

Data Register	Input Data	Output Data
MDU_A	$\cos_i$	$\cos_o$
MDU_B	$\theta$	—
MDU_C	$\sin_i$	$\sin_o$
MDU_D	—	—

### 10.3.8 Arctangent

When MDU\_MD[2:0] = 101, MDU module works in arctangent mode.

Arctangent function calculates the magnitude and angle of the vector based on the input sine and cosine values.

The calculation formula is:

$$U = \sqrt{(U \sin \theta)^2 + (U \cos \theta)^2}$$

$$\theta = \tan^{-1} \left( \frac{U \sin \theta}{U \cos \theta} \right)$$

Where,

$U \sin \theta$ : Sine component of vector

$U \cos \theta$ : Cosine component of vector

$\theta$ : Calculated vector angle

$U$ : Calculated vector magnitude

As shown in Table 10-7,  $Ucos\theta$ ,  $Usin\theta$ ,  $U$  and  $\theta$  are 16-bit signed data.  $Ucos\theta$  is written to MDU\_A and  $Usin\theta$  to MDU\_C to calculate  $U$  and  $\theta$ .  $U$  is read by MDU\_A, and  $\theta$  is read by MDU\_B.

Table 10-7 Register Definitions in Arctangent Mode

Data Register	Input Data	Output Data
MDU_A	$Ucos\theta$	$U$
MDU_B	—	$\theta$
MDU_C	$Usin\theta$	—
MDU_D	—	—

## 10.4 MDU Registers

### 10.4.1 MDU\_CR (0xC1)

Bit	7	6	5	4	3	2	1	0
Name	MDUBUSY	MDUDONE	MDURUN	RSV				
Type	R	W1	W1	—	—	—	—	—
Reset	0	0	0	—	—	—	—	—
Bit	Name	Description						
[7]	MDUBUSY	MDU Busy Flag MDU starts after MDU_C[7:0] is written. 0: MDU idle 1: MDU operating						
[6]	MDUDONE	MDU Operation End Bit 0: No effect 1: This bit is set to 1 by software after MDU ends its operation. This operation ensures that MDU calculation is correct when it is invoked in different interrupt services and master programs.						
[5]	MDURUN	MDU Start Operation Bit 0: No effect 1: This bit is set to 1 by software before MDU starts. This operation ensures that the MDU calculation is correct when it is invoked in different interrupt services and master programs.

## 11 PI/PID

### 11.1 PI/PID Introduction

PI/PID regulator is a linear controller, where the output is generated by linear combination of error proportional (P), integral (I) and differential (D) actions, and then implemented by an actuator. In motor control systems, it is used for speed and position control.

PI formula:

$$U_k = U_{k-1} + Kp \times (E_k - E_{k-1}) + Ki \times E_k$$

PID formula:

$$U_k = U_{k-1} + Kp \times (E_k - E_{k-1}) + Ki \times E_k + Kd \times (E_k - 2 \times E_{k-1} + E_{k-2})$$

Where,

$U_k$ : Output for round k of calculation

$U_{k-1}$ : Output for round of k - 1 calculation

$E_k$ : Deviation for round k of input

$E_{k-1}, E_{k-2}$ : Deviations for round k-1 and round k-2 of inputs

$Kp, Ki, Kd$ : Proportional, integral and differential coefficients of regulator

Maximum value of  $U_k$  is presented as  $PIx\_UKMAX$  ( $x = 0 \sim 3$ ) and the minimum value as  $PIx\_UKMIN$ .

### 11.2 PI/PID Features

- Parameter range is configurable
- Support multiple invocations but not with nested interrupt
- Produce a 32-bit result  $PIx\_UK$
- Read the results after the busy flag is reset to "0"

### 11.3 PI/PID Operations

1. Initialize MDU before the operations, and configure  $Kp, Ki, Kd$  and the maximum and minimum values of  $U_k$ ;
2. Set  $PI\_CR[PIxSTA] = 1$  to start PI/PID operation. The busy flag  $PI\_CR[PIBSY]$  is automatically set to "1";
3. Read  $PI\_CR[PIBSY]$  in software.  $PI\_CR[PIBSY]$  reading of 0 indicates that the calculation is completed and calculation result  $PIx\_UK$  is updated;
4. Read  $PIx\_UK$  to obtain the output.

Notes:

- The data format of  $PI\_KP$  is Q12 and that of other registers is Q15.
- $PIx\_UK$  and  $PIx\_EK1$  values default to the last calculated  $UK$  and  $Ek$ . The related values change after  $PIx\_EK1$  and  $PIx\_UK$  are written.
- When PI controller is invoked repeatedly, related parameters shall be saved after each PI operation and

initialized before next PI operation. Initialization codes are shown as below:

```

PIx_KP = KP;           //Initialize Kp
PIx_KI = KI;           //Initialize Ki
PIx_KD = KD;           //Initialize Kd
PIx_UKMAX = UKMAX;     //Initialize maximum output
PIx_UKMIN = UKMIN;     //Initialize minimum output
PIx_EK1 = X;           //Initialize  $E_{k-1}$ 
PIx_UKH = Y1;          //Initialize 16 high bits of  $U_{k-1}$ 
PIx_UKL = Y2;          //Initialize 16 low bits of  $U_{k-1}$ 

```

## 11.4 PI/PID Registers

### 11.4.1 PI\_CR (0xF9)

**12 FOC**

**12.1 FOC Overview**

**12.1.1 FOC Introduction**

FOC module is used in sensorless and sensed FOC motor drive applications and SVPWM-based motor control applications. When DRV\_CR[FOC\_EN] = 0, FOC module is inactivated and FOC clock stops. The relevant registers are forced into the reset state and cannot be written.

FOC module consists of angle estimator, PI controller, coordinate transformation module, current sampling module and PWM output module, which implements current closed loop in hardware. The angle estimator uses the sampling motor current to estimate the rotor position and implement sensorless FOC-based motor control. MCU can also process signals from the position sensor to obtain the rotor position and implement sensed FOC-based motor control.

- Sensorless FOC: Angle for coordinate transformation is obtained by angle estimator, and the motor speed is estimated for speed closed-loop control.
- Sensed FOC: FOC module provides the angle input interface. MCU samples position sensor signal and calculates the electrical angle of motor. Software sends the result to FOC module for coordinate transformation.

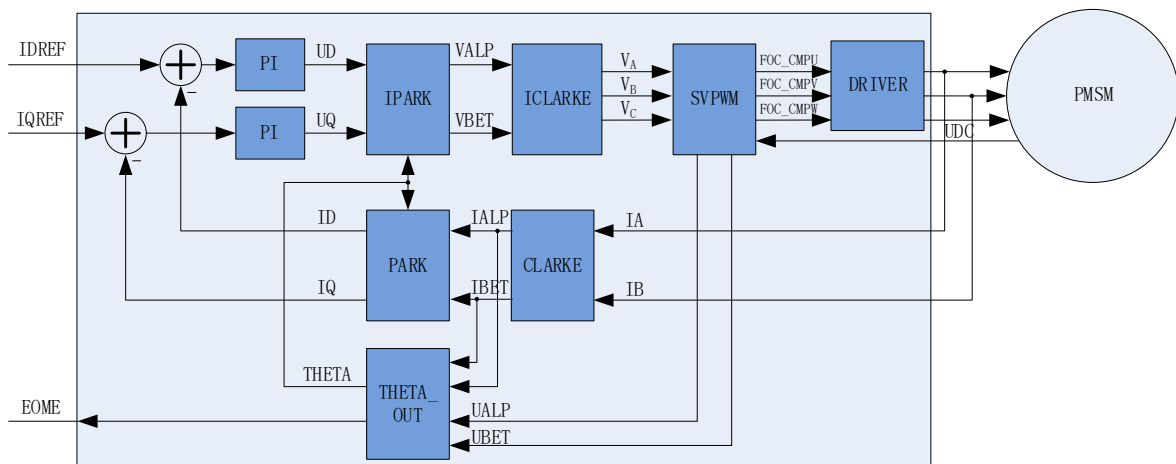

Figure 12-1 Schematic Diagram of FOC

**12.1.2 Reference Voltage (VREF) Input**

The current loop of FOC module uses the d-axis current reference value FOC\_IDREF and the q-axis current reference value FOC\_IQREF as the reference, and uses the d-axis current sampling value FOC\_ID and the q-axis current sampling value FOC\_IQ as the feedback. FOC module provides real-time estimated motor speed FOC\_EOME. MCU can use FOC\_EOME as the feedback to build speed loop and send the output of speed loop to FOC\_IQREF to implement the speed-current dual closed loop control.

**12.1.3 PI Controller**

FOC module integrates 2 PI controllers:

1. Flux control: PI controller of d-axis current, with current reference FOC\_IDREF minus feedback current FOC\_ID as the error input, proportional coefficient FOC\_DQKP and the integral coefficient FOC\_DQKI for adjustment of PI performance, and FOC\_DMAX and FOC\_DMIN for limiting of the output amplitude. The output is voltage reference of d-axis FOC\_UD;
2. Torque control: PI controller of q-axis current, with current reference FOC\_IQREF minus feedback current FOC\_IQ as the error input, proportional coefficient FOC\_DQKP and the integral coefficient FOC\_DQKI for adjustment of PI performance, and FOC\_QMAX and FOC\_QMIN for limiting of the output amplitude. The output is voltage reference of q-axis FOC\_UQ.

**12.1.4 Coordinate Transformations**

**12.1.4.1 Inverse Park Transformation**

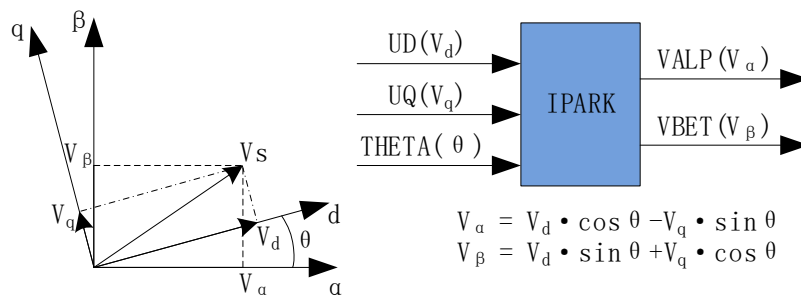

Figure 12-2 Inverse Park Transformation

Inverse Park transformation is used to transform two voltage vectors obtained by PI controller, FOC\_UD and FOC\_UQ, from dq-axis coordinate to αβ-axis coordinate.

**12.1.4.2 Inverse Clarke Transformation**

Figure 12-3 Inverse Clarke Transformation

Inverse Clarke transformation is used to transform voltage vector from  $\alpha\beta$ -axis coordinate to 3-phase stationary coordinate.

**12.1.4.3 Clarke Transformation**

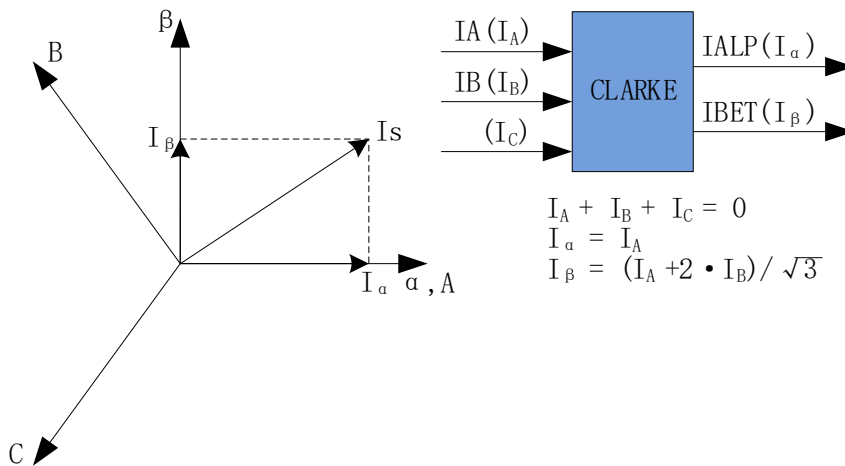

Figure 12-4 Clarke Transformation

Clarke transformation is used to transform the sampled current from 3-phase stationary coordinate to  $\alpha\beta$ -axis coordinate.

**12.1.4.4 Park Transformation**

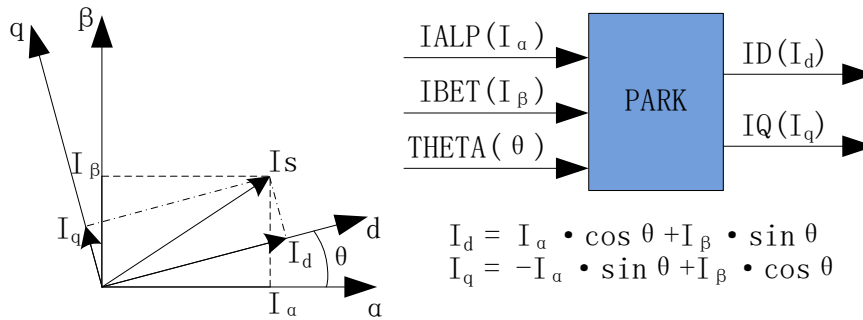

Figure 12-5 Park Transformation

Park transformation is used to transform the current vectors, obtained after Clarke transformation, from  $\alpha\beta$ -axis coordinate to  $dq$ -axis coordinate to get the sampled  $dq$ -axis current FOC\_\_ID and FOC\_\_IQ.

**12.1.5 SVPWM**

SVPWM algorithm is an important part of FOC. The main idea is to obtain quasi-circular rotating magnetic field by switching the inverter space voltage vectors. This method decreases harmonic components of the phase current, harmonic losses of the motor and torque ripple, and achieves high voltage utilization.

SVPWM generates pulse-width modulation signals for the 3-phase motor voltage control, whose process can be reduced to a few simple equations. Since high side and low side of the inverter cannot be turned on simultaneously, there are two states for a phase, i.e., phase connected to bus voltage (represented by 1) or phase connected to ground (represented by 0). Therefore, voltage vector output of the inverter has a total of  $2^3 = 8$  possible states.  $X_C X_B X_A$  represents the voltage vectors, where  $X_C$  represents the state of C phase,  $X_B$  represents the state of B phase and  $X_A$  represents the state of A phase. For example, 100 represents the state that C phase voltage is connected to bus voltage and A, B phases are connected to ground. When the states of 3-phase are all 1 or 0, there is no voltage drop between two phases and the state is called inactive state or zero voltage vector. The other 6 states which have voltage output are active voltage vectors with an adjacent state rotation offset of 60 degrees.

Figure 12-6 SVPWM Voltage Vector

SVPWM uses the sum of two adjacent vectors to generate any voltage vector located in the voltage vector space. As shown in Figure 12-7,  $U_{OUT}$  is the desired vector and it is in the sector between  $U_{60}$  and  $U_0$ . Based on the principle of equal impulse, the effect,  $U_0$  applied  $2 \cdot T_1$  time and  $U_{60}$  applied  $2 \cdot T_2$  time, is equivalent to the  $U_{OUT}$ . The rest of time ( $T_0$ ) is applied by zero voltage vector.

Figure 12-7 Voltage Vector Synthesis

Table 12-1 Inverter States of SVPWM

C phase	B phase	A phase	$U_{ALP}$	$U_{BET}$	State
0	0	0	0	0	000
0	0	1	$2/3 \cdot U_{DC}$	0	001
0	1	1	$1/3 \cdot U_{DC}$	$1/3 \cdot U_{DC}$	011
0	1	0	$-1/3 \cdot U_{DC}$	$1/3 \cdot U_{DC}$	010
1	1	0	$-2/3 \cdot U_{DC}$	0	110
1	0	0	$-1/3 \cdot U_{DC}$	$-1/3 \cdot U_{DC}$	100
1	0	1	$1/3 \cdot U_{DC}$	$-1/3 \cdot U_{DC}$	101
1	1	1	0	0	111

### 12.1.5.1 Continuous SVPWM

In single-shunt current sampling mode, Continuous SVPWM is always used. In dual/triple-shunt current sampling mode, FOC\_CR2[F5SEG] is set to 0 to select Continuous SVPWM as the output mode.

Figure 12-8 Continuous SVPWM Output Waveform

### 12.1.5.2 Discontinuous SVPWM

Discontinuous SVPWM is available in the dual/triple-shunt current sampling mode. FOC\_CR2[F5SEG] is set to 1 to activate this mode.

Figure 12-9 Discontinuous SVPWM Output Waveform

### 12.1.6 Overmodulation

Overmodulation is available in single/dual/triple-shunt current sampling mode. FOC\_CR1[OVMDL] is set to 1 to activate this mode. The output, FOC\_\_UD and FOC\_\_UQ, and limit value, FOC\_DMAX and FOC\_QMIN, will be multiplied by 1.15 in this mode.

### 12.1.7 Deadtime Compensation

Deadtime compensation is available in dual/triple-shunt current sampling mode. The compensation value of deadtime is configured by FOC\_TSMIN. This mode improves the quality of phase current at low speed.

### 12.1.8 Current and Voltage Sampling

In FOC mode, bus voltage and phase current are sampled by hardware automatically. Before the FOC module operates, ADC and operational amplifier shall be enabled and the corresponding control registers be configured. No configuration is required for ADC channel and mode. Current sampling mode, single/dual/triple-shunt, is selected by setting FOC\_CR1[CSM]. In single-shunt mode, default sampling channel of the bus current (itrip) is ADC channel 4. In dual-shunt mode, default sampling channels of A phase current (ia) and B phase current (ib) are ADC channel 0 and

channel 1 respectively. In triple-shuntmode, default sampling channels of ia, ib and C phase current (ic) are ADC channel 0, channel 1 and channel 4 respectively. Channel 14, with built-in voltage divider to sample VCC directly, or channel 2 can be selected for bus voltage sampling.

**12.1.8.1 Single-shunt Current Sampling Mode**

FOC\_CR1[CSM] is set to 00 to select the single-shunt current sampling mode. In this mode, FOC module samples itrip twice during the DRV timer counting-up operation, and samples the bus voltage during the DRV timer counting-down operation after FOC module completes the calculation.

Since deadtime affects the accuracy of current sampling, FOC module samples within T1' and T2', which is the applied time of active voltage vector with deadtime removed. FOC\_TRGDLY is the register which moves the current sampling time, and this register shall be configured reasonably to ensure sampling is completed within T1' and T2'. For example, FOC\_TRGDLY = 5, the sampling time is delayed by 5\*T = 208ns; FOC\_TRGDLY = 0xFB(-5), the sampling time is advanced by 5\*T = 208ns.

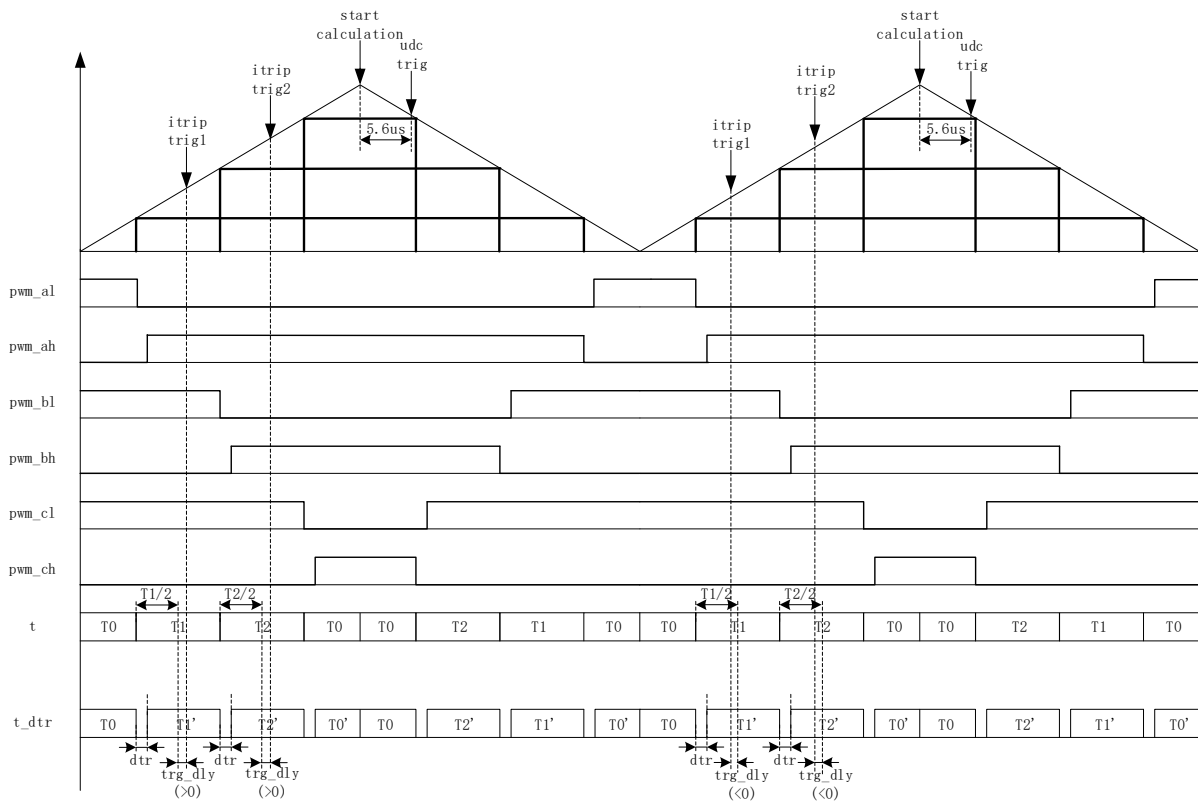

Figure 12-10 Single-shunt Current Sampling Timing Diagram

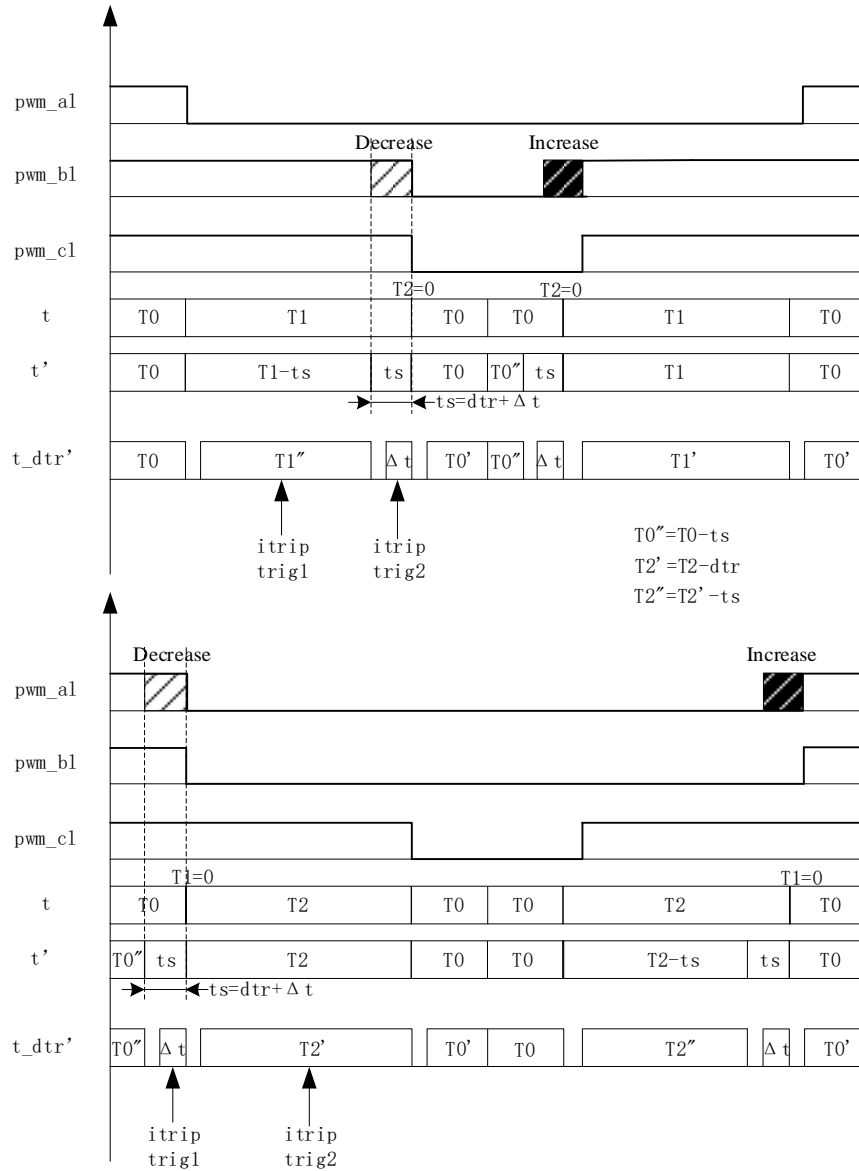

Figure 12-11 PWM Wave Shift in Single-shunt Current Sampling Mode

The time of sampling window may be not enough to sample the current in low modulation index and sector switching area. PWM waveform shall be adjusted to ensure the minimum sampling window required in the case. FOC\_TSMIN (FOC\_TSMIN = minimum sampling window + deadtime) is used to configure the minimum active voltage vector applied time, and FOC module adjusts the PWM waveform automatically.

**12.1.8.2 Dual/Triple-shunt Current Sampling Mode**

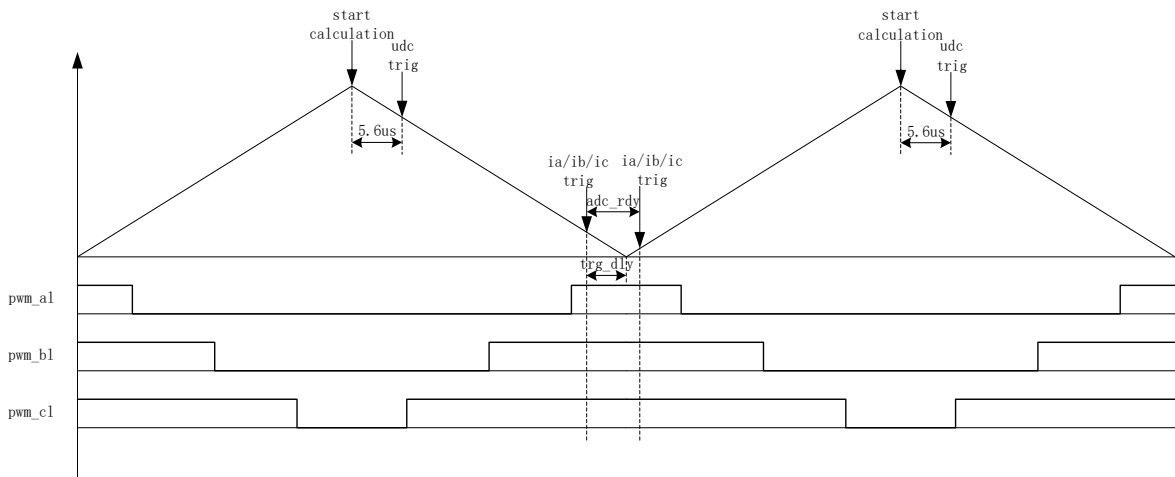

Figure 12-12 Dual/Triple-shunt Sequential Current Sampling Mode

FOC\_CR1[CSM] is set to 10/11 and FOC\_CR2[DSS] to 0 to select dual/triple-shunt concurrent current sampling mode. In triple-shunt mode, FOC\_TRGDLY is used to configure the sampling time of a phase current (ia/ib/ic is determined according to the sector), and other phases are sampled at the end of previous sampling. In dual-shunt mode, FOC\_TRGDLY is used to configure the sampling time of ia, and ib is sampled at the end of ia sampling. TRG\_DLY shall be configured reasonably to ensure current sampling time is within zero voltage vector (000). For example, when FOC\_TRGDLY = 0xB2 and FOC counter counts down, ia/ib/ic is sampled at  $50 * T = 2.08 \mu s$  before an underflow event, and then the other phases of ia/ib/ic are sampled.

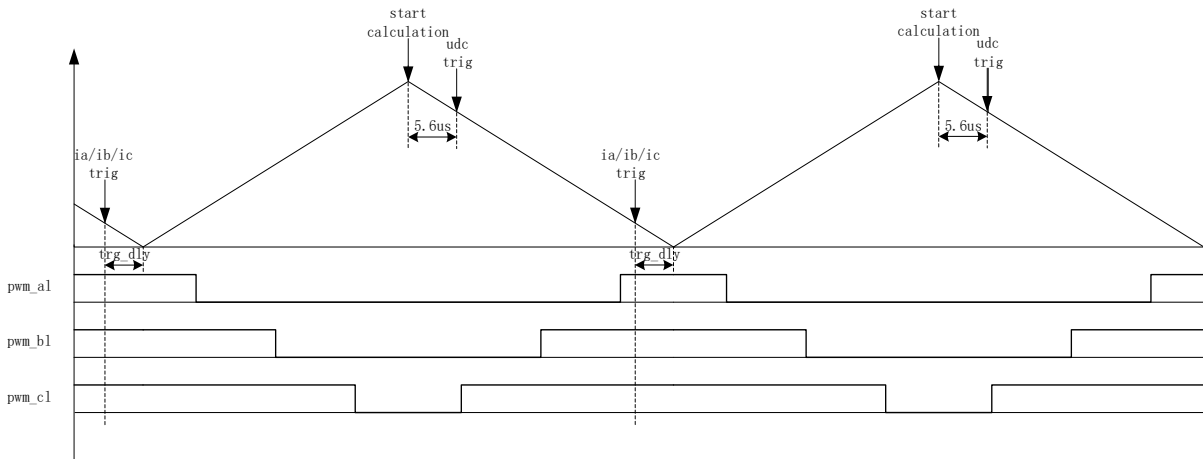

Figure 12-13 Dual/Triple-Shunt Alternating Current Sampling Mode

FOC\_CR1[CSM] is set to 10/11 and FOC\_CR2[DSS] to 1 to select dual/triple-shunt alternating current sampling mode. In this mode, FOC module performs calculation in every PWM cycle. However, only one phase current is sampled at each PWM cycle (ia/ib/ic is determined according to the sector). The first carrier cycle samples one phase of the ia/ib/ic, and the second carrier cycle samples the current of the other phase, so as to alternately sample

the current of two phases in three phases. FOC\_TRGDLY is used to configure the sampling time of ia (channel 0), ib (channel 1) and ic (channel 4). TRG\_DLY shall be configured reasonably to ensure sampling time for the current of ia (Channel 0), ib (Channel 1) or ic (Channel 4) is within zero voltage vector (000). For example, when FOC\_TRGDLY = 0xB2 and FOC counter counts-down, phase current is sampled at  $50 * T = 2.08 \mu s$  before an underflow event.

In dual/triple-shunt current sampling mode, bus voltage is sampled when driver counter is down-counting and FOC module completes the calculation.

### 12.1.8.3 Current Sampling Offset

The current sampling offset voltage shall be added to sample full range of current due to the existence of the positive and negative phase current. When phase current is 0, ADC result is the offset value. ADC result minus this value, 0x4000 default, is the sampling current. Since ADC reference voltage and hardware are nonideal, there is a deviation between the default value and the real value. Therefore, it is necessary to calibrate the offset. The calibration procedure is as follows. When there is no current in three phases, MCU starts to sample the corresponding channel and the results, averaging all the sampled value, is written to FOC\_CSO. Providing ADC sampling range is 0 ~ 5V and the offset is 2.5V,  $FOC\_CSO = 2.5V/5V * 32768 = 16384$  (0x4000).

- When FOC\_CHC[CSOC] = 00/11, FOC\_CSO is written to modify the offset of itrip and ic.
- When FOC\_CHC[CSOC] = 01, FOC\_CSO is written to modify the offset of ia.
- When FOC\_CHC[CSOC] = 10, FOC\_CSO is written to modify the offset of ib.

### 12.1.9 Angle Mode

Angle module includes angle estimation module, ramping module and estimated angle smooth switching module.

The sources of angle are as follows:

- Forced ramping angle
- Forced pulling angle
- Estimated angle of estimator
- Forced angle of estimator

Table 12-2 Sources of Angle

FOC_CR1[RFAE]	FOC_CR1[ANGM]	FOC_CR1[EFAE]	Sources of Angle
1	X	X	Forced ramping angle
0	0	X	Forced pulling angle
0	1	0	Estimated angle of estimator
0	1	1	$\omega > FOC\_EFREQMIN$ : Estimated angle of estimator $\omega < FOC\_EFREQMIN$ : Forced angle of estimator

### 12.1.9.1 Forced Ramping Angle

Forced ramping angle is controlled by angle register FOC\_\_THETA, speed register FOC\_\_RTHESSTEP, acceleration register FOC\_RTHEACC and ramping timer FOC\_RTHECNT. The formula is:

$$\text{FOC\_RTHESSTEP (32-bit)} = \text{FOC\_RTHESSTEP (32-bit)} + \text{FOC\_RTHEACC (low 16 bits)}$$

$$\text{THETA\_OL (16-bit)} = \text{THETA\_OL (16-bit)} + \text{FOC\_RTHESSTEP (high 16 bits)}$$

Where, THETA\_OL is an internal variable of the chip. In forced ramping angle mode, THETA\_OL is written to FOC\_\_THETA as the used angle. If the software writes a value to FOC\_\_THETA, this value is written to THETA\_OL as well.

Forced ramping angle has the highest priority. Ramping module makes a ramping operation in every PWM cycle and the counter is added by 1. When the value of the counter reaches the set value by FOC\_RTHECNT, FOC\_CR1[RFAE] is cleared by hardware, and then the ramping is completed.

Thereafter, according to the value of FOC\_CR1[ANGM], the angle comes from estimator (FOC\_CR1[ANGM] = 1) or forced pulling angle (FOC\_CR1[ANGM] = 0).

### 12.1.9.2 Forced Pulling Angle

Forced pulling angle is controlled by angle register FOC\_\_THETA, speed register FOC\_\_RTHESSTEP. The formula is:

$$\text{THETA\_OL (16-bit)} = \text{THETA\_OL (16-bit)} + \text{FOC\_RTHESSTEP (high 16 bits)}$$

Where, THETA\_OL is an internal variable of the chip. In forced pulling angle mode, THETA\_OL is written to FOC\_\_THETA as the used angle. If the software writes a value to FOC\_\_THETA, this value will be written to THETA\_OL as well.

- When FOC\_CR1[RFAE] is set to 1 and FOC\_CR1[ANGM] to 0, MCU switches to forced pulling angle mode starts after forced ramping angle mode. The speed is the cumulative result after ramping. This mode implements a forced uniform speed control.
- When FOC\_CR1[RFAE] is set to “0” and FOC\_CR1[ANGM] to “0”, the angle is the forced pulling angle and the speed of FOC\_\_RTHESSTEP is the initial speed written by software. Configuring FOC\_\_RTHESSTEP to “0” enables the pre-position feature. The sensor-based FOC is implemented after the motor speed is set with FOC\_\_RTHESSTEP. (Principle of Sensor-based FOC: The angle and speed are written to FOC\_\_THETA and FOC\_\_RTHESSTEP by software, and FOC module generates an angle in each PWM cycle based on the written values.)

**12.1.9.3 Estimator Angle**

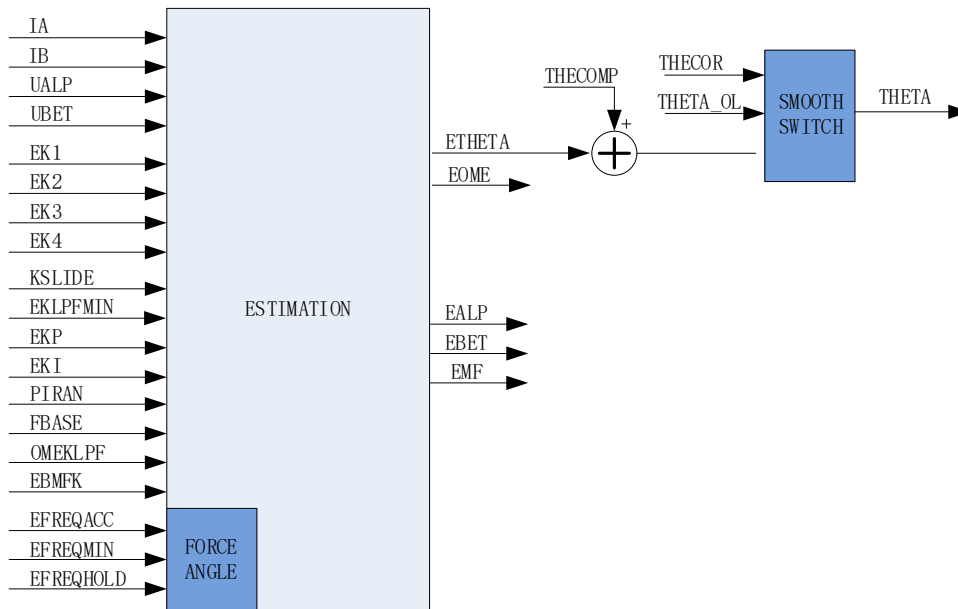

Figure 12-14 Schematic Block Diagram of Estimator

**12.1.9.3.1 Estimated Angle of Estimator**

The estimator builds the motor model based on the motor parameters and control parameters, and outputs the estimated angle based on the sampling current and output voltage. The estimator operates in PLL mode or SMO mode by configuring FOC\_CR2[ESEL] bit.

**12.1.9.3.2 Forced Angle of Estimator**

Figure 12-15 Schematic Block Diagram of Forced Angle of Estimator

This feature is similar to the ramping feature. Due to the low speed at motor starting process, there may be a deviation in angle and speed estimation with the small effective signal, resulting in startup failure. In this case, the estimator outputs the forced angle to ensure the motor start normally.

The forced angle feature of the estimator is enabled when FOC\_CR1[RFAE] is set to 0, FOC\_CR1[ANGM] to 1 and FOC\_CR1[EFAE] to 1. As shown in Figure 12-15, the estimator compares the value of real-time estimated speed

( $\omega$ ) and FOC\_EFREQMIN to determine  $\omega$  or forced speed as the used speed (OME). When  $\omega < \text{FOC\_EFREQMIN}$ , the forced speed is selected as EOME. The forced speed starts with 0 and increases by FOC\_EFREQACC in each PWM cycle, with the maximum value FOC\_EFREQHOLD. When  $\omega \geq \text{FOC\_EFREQMIN}$ ,  $\omega$  is selected as EOME.

Estimated speed of the estimator FOC\_\_EOME is the low-pass filtering result of OME with the coefficient set by FOC\_OMEKLPF.

**12.1.9.3.3 Angle Smooth Switching**

Figure 12-16 Angle Smooth Switching Waveform

When FOC\_CR1[RFAE] is set to 1 and FOC\_CR1[ANGM] to 1, the motor starts with ramping feature. At the end of the ramping, it switches to estimator angle mode. However, there is usually a deviation between the estimated angle (FOC\_ETHETA) and the forced ramping angle (THETA\_OL). If the angle is switched from forced ramping angle to estimated angle directly, motor jitter may occur due to such a sudden change. To deal with this problem, a smooth switching is preferred.

At the end of the ramping, if the deviation between FOC\_ETHETA and THETA\_OL is less than or equal to FOC\_THECOR, FOC\_ETHETA is selected as the output angle. But if the deviation is larger than FOC\_THECOR, THETA\_OL is modified smoothly with the step of FOC\_THECOR at every PWM cycle until it is close to FOC\_ETHETA. After the deviation is less than THECOR, FOC\_ETHETA is selected as the output angle.

**12.1.9.3.4 Angle Compensation**

Angle compensation value FOC\_THECOMP is used to compensate for the estimated angle FOC\_\_ETHETA. If FOC\_THECOMP is negative, the lagged angle is compensated; if it is positive, the advanced angle is compensated.

**12.1.10 Motor Real Time Parameters**

MCU monitors the state of motor using the following real time variables provided by FOC module:

- Used angle FOC\_\_THETA

- Estimated angle FOC\_\_ETHETA, Estimated speed FOC\_\_EOME
- d-axis voltage FOC\_\_UD, q-axis voltage FOC\_\_UQ
- d-axis current FOC\_\_ID, q-axis current FOC\_\_IQ
- $\alpha$ -axis voltage FOC\_\_VALP,  $\beta$ -axis voltage FOC\_\_VBET
- Bus voltage FOC\_\_UDCFLT
- Phase current FOC\_\_IA, FOC\_\_IB, FOC\_\_IC and maximum phase current FOC\_\_IAMAX, FOC\_\_IBMAX, FOC\_\_ICMAX
- $\alpha$ -axis current (equal to FOC\_\_IA),  $\beta$ -axis current FOC\_\_IBET
- $\alpha$ -axis BEMF FOC\_\_EALP,  $\beta$ -axis BEMF FOC\_\_EBET
- Magnitude of BEMF FOC\_\_EMF
- Motor power FOC\_\_POW

### 12.1.10.1 RSD

FOC provides RSD (detection of rotating state: upwind and downwind) feature. FOC module starts to operate when FOC\_CR0[ESCMS] is set to 1, FOC\_IDREF to 0, and FOC\_IQREF to 0. Motor's rotor state is detected by FOC\_\_ETHETA and FOC\_\_EOME. If FOC\_\_ETHETA decreases or FOC\_\_EOME is a negative value, the motor rotates upwind and it is necessary to brake first and then start the motor with ramping forced angle mode. If FOC\_\_ETHETA increases or FOC\_\_EOME is a positive value, the motor rotates downwind and can be started using estimated angle directly.

### 12.1.10.2 BEMF Detection

Estimator estimates  $\alpha$ -axis BEMF FOC\_\_EALP and  $\beta$ -axis BEMF FOC\_\_EBET with the motor parameters, and calculates the magnitude of BEMF (FOC\_\_EMF), which implements protection features, such as lock protection or phase unconnected protection.

### 12.1.10.3 Motor Power

FOC module calculates motor power based on the sampling current, modulation index of SVPWM and bus voltage.

### 12.1.11 FG Generation

FG signal is generated by FOC module and Timer4. FOC module calculates an FG value based on frequency base fbase, low-pass filtered speed FOC\_\_EOMELPF and FG coefficient FOC\_\_KFG in every PWM cycle. The result is updated to TIM4\_ARR automatically and half of the result (TIM4\_ARR/2) to TIM4\_DR by hardware. It shall be noted that Timer4 must work in output mode and the clock division factor of Timer4 shall be configured according to the motor maximum speed. FOC\_\_KFG is set as:  $FOC\_KFG = \text{SYSCLK} / (2^{\text{TIM4\_CR0}[T4PSC]} * \text{fbase} * x)$ , where, x refers to the expected number of FG signal in one electric cycle. If the result exceeds 65535, the clock division factor TIM4\_CR0[T4PSC] shall be adjusted.

When FOC\_\_KFG = 0, this feature is disabled and TIM4\_\_ARR and TIM4\_\_DR will not be updated.

## 12.2 FOC Registers

### 12.2.1 FOC\_CR0 (0x409F)

Bit	7	6	5	4	3	2	1	0
Name	OMIF	OMAF	MERRS		UCSEL	OMAS	ESCMS	EDIS
Type	R	R	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	OMIF	omega < FOC_EFREQMIN flag. This bit is valid even if FOC_CR1[EFAE] = 0 0: omega ≥ FOC_EFREQMIN 1: omega < FOC_EFREQMIN						
[6]	OMAF	omega > FOC_EFREQMAX flag 0: omega ≤ FOC_EFREQMAX 1: omega > FOC_EFREQMAX						
[5:4]	MERRS	The maximum error in SMO 00: 0.5 01: 0.25 10: 0.125 11: 1.0						
[3]	UCSEL	Sampling Channel for Bus Voltage (UDC) In FOC mode, bus voltage is sampled automatically by hardware after Driver counter is enabled. This bit selects the ADC channel for bus voltage sampling 0: ADC channel 2 1: ADC channel 14 ADC channel 14 is the internal channel dedicated for bus voltage sampling, and the voltage division ratio is selected by configuring ADC_CR[ADCRATIO]. ADC channel 2 is the external bus voltage sampling channel, which uses external voltage resistor division Note: It is not necessary to set the associated Enable Bit in ADC_MASK register to “1”.						
[2]	OMAS	Output selection when omega is too large When omega[15:8] is larger than FOC_EFREQMAX, OME is set as: 0: FOC_EFREQMAX*256 1: FOC_EFREQHOLD						
[1]	ESCMS	Angle Output Mode Selection 0: Test mode 1: Recommended mode						
[0]	EDIS	FOC__EALP/FOC__EBET Auto-computation Disabled 0: Not forbid 1: Forbid						

### 12.2.2 FOC\_CR1 (0x40A0)

Bit	7	6	5	4	3	2	1	0
Name	OVMDL	EFAE	RFAE	ANGM	CSM		RSV	SVPWMEN
Type	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W
Reset	0	0	0	0	0	0	—	0
Bit	Name	Description						
[7]	OVMDL	Overmodulation Enable 0: Disable 1: Enable						
[6]	EFAE	Forced Angle of Estimator Enable When this feature is enabled, angle mode is determined by the estimator, and it switches to estimated angle mode automatically. 0: Disable 1: Enable						

[5]	RFAE	Forced Ramping Angle Enable When this feature is enabled, angle mode is determined by the ramping module. After ramping, it switches to estimated mode or forced pulling mode according to FOC_CR1[ANGM]. FOC_CR1[RFAE] is cleared to 0 by hardware as well. 0: Disable 1: Enable
[4]	ANGM	Angle Mode When FOC_CR1[RFAE] = 0, angle mode is determined by this bit. When FOC_CR1[RFAE] = 1, angle mode is determined by this bit after ramping. 0: Forced pulling angle mode 1: Estimated Angle of Estimator mode
[3:2]	CSM	Current Sampling Mode 00: Single-shunt current sampling mode 01: Dual-shunt current sampling mode 10: Reserved 11: Triple--shunt current sampling mode
[1]	RSV	Reserved
[0]	SVPWMEN	SVPWM Enable 0: Disable 1: Enable

### 12.2.3 FOC\_CR2 (0x40A1)

Bit	7	6	5	4	3	2	1	0
Name	ESEL	ICLR	F5SEG	DSS	CSOC		UQD	UDD
Type	R/W	R/W1	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[7]	ESEL	Angle Estimator Mode Selection 0: SMO 1: PLL. FOC_KSILDE register is FOC_PLLKP of PI controller, and FOC_KLPMIN register is FOC_PLLKI of PI controller.
[6]	ICLR	Clear FOC_IAMAX/FOC_IBMAX/FOC_ICMAX to "0" 0: No effect. 1: This bit is cleared to 0 by hardware after FOC_IAMAX/ FOC_IBMAX/ FOC_ICMAX is cleared to 0.
[5]	F5SEG	SVPWM Mode Selection 0: Continuous SVPWM 1: Discontinuous SVPWM (cannot be selected in single-shunt current sampling mode)
[4]	DSS	Current Sampling Discontinuous Mode Selection in Dual/Triple-shunt Mode 0: Sequential sampling mode, where current values of two phases are sampled in each carrier period. 1: Alternating sampling mode. FOC module completes the calculation in every PWM cycle. The current of one phase is sampled in each PWM cycle, and the current of two phases are sampled alternately in two adjacent PWM cycles.
[3:2]	CSOC	Current Sampling Offset Calibration Selection This bit is written to select the offset of FOC_CSO. In single-shunt sampling, 00 or 11 is written to calibrate itrip offset. In dual-shunt sampling, 01 is written to calibrate ia offset and 10 to calibrate ib offset. In triple-shunt sampling, 01 is written to calibrate ia offset, 10 to calibrate ib offset and 00 or 11 to calibrate ic offset. 00: itrip and ic 01: ia 10: ib 11: itrip and ic
[1]	UQD	q-Axis PI controller disabled, where FOC__UQ value is no longer updated by the PI controller. 0: Not forbid 1: Forbid

[0]	UDD	d-Axis PI controller disabled, where the FOC__UD value is no longer updated by the PI controller. 0: Not forbid 1: Forbid
-----	-----	---

**12.2.4 FOC\_TSMIN (0x40A2)**

Bit	7	6	5	4	3	2	1	0
Name	FOC_TSMIN							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	FOC_TSMIN	Single-shunt sampling mode: Minimum window for sampling Dual/triple-shunt sampling mode: Deadtime compensation Range: [0,255] TSMIN = sampling window $T_{window}$ + deadtime $T_{DT}$ Providing $T_{window} = 1\mu s$ , $T_{DT} = 1\mu s$ , $TSMIN = 2\mu s$ , $T_s = 62.5\mu s$ , $FOC\_TSMIN = (1 + 1)/62.5 * 4096 = 131$						

**12.2.5 FOC\_TGLI (0x40A3)**

Bit	7	6	5	4	3	2	1	0
Name	FOC_TGLI							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	FOC_TGLI	Narrow Pulse Elimination for High Side of the Bridge This feature is used in high voltage applications. The high side of bridge must be longer than a certain time. After this bit is configured, high side of the bridge is not turned on when the conducting time is less than this value. Range: [0,255] Providing to eliminate pulse narrower than $1\mu s$ , $T_{DT} = 1\mu s$ , $T_s = 62.5\mu s$ $FOC\_TGLI = (1 + 1)/62.5 * 4096 = 131$						

**12.2.6 FOC\_TBLO (0x40A4)**

Bit	7	6	5	4	3	2	1	0
Name	FOC_TBLO							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	FOC_TBLO	Sampling Masking Time in Triple-shunt Sampling Mode When low side of the bridge is turned on for less than FOC_TBLO, the current of this phase is not sampled and obtained through special process. Range: [0,255] Providing the current is not sampled when low side of the bridge is turned on for less than $1\mu s$ , $FOC\_TBLO = 1000ns/41.67ns = 24$						

**12.2.7 FOC\_TRGDLY (0x40A5)**

Bit	7	6	5	4	3	2	1	0
Name	FOC_TRGDLY							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	FOC_TRGDLY	Time Configuration for Current Sampling When FOC_TRGDLY is set to 0, FOC module samples the current as follows. Single-shunt sampling mode: Midpoint between deadtime and applied time of active voltage vector. Dual/triple-shunt sampling mode: Midpoint of voltage vector 000 (minima of Driver counter) Range: [-128,127] Single-shunt sampling mode: If FOC_TRGDLY = 5, it delays $5 * T = 208\text{ns}$ to sample the current, and if FOC_TRGDLY = -5, it advances $5 * T = 208\text{ns}$ . Dual/triple-shunt sampling mode: If FOC_TRGDLY = -5 and Driver counter counts downward, it samples the current at $5 * T = 208\text{ns}$ before an overflow event occurs. If FOC_TRGDLY = 5 and Driver counter counts upward, it samples the current at $5 * T = 208\text{ns}$ after an overflow event occurs.						

**12.2.8 FOC\_CSO (0x40A6, 0x40A7)**

FOC_CSOH(0x40A6)								
Bit	15	14	13	12	11	10	9	8
Name	FOC_CSO[15:8]							
Type	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	0	0	0	0	0	0
FOC_CSOL(0x40A7)								
Bit	7	6	5	4	3	2	1	0
Name	FOC_CSO[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[15:0]	FOC_CSO	Current Sampling Offset FOC_CR2[CSOC] is configured to select the current, and FOC_CSO is written to calibrate current sampling offset of itrip in single-shunt mode, ia, ib in dual-shunt mode and ia, ib and ic in triple-shunt mode. Range: [0,32767]; MSB is always 0. Providing ADC sampling voltage range is 0V ~ 5V and offset is 2.5V, $\text{FOC\_CSO} = 2.5\text{V}/5\text{V} * 32768 = 16384 (0x4000)$						

**12.2.9 FOC\_RTSTEP (0x40A8, 0x40A9)**

FOC_RTSTEPH(0x40A8)								
Bit	15	14	13	12	11	10	9	8

ADC channel 2 (external voltage divider) or channel 14 (internal voltage divider) can be selected.</p> <p>Range: [0,32767] Providing the sampled bus voltage is divided by 6 and ADC voltage range is 0V ~ 5V, the sampling range of bus voltage is 0V ~ 30V. Providing FOC__UDCFLT is 19661(0x4CCD), the bus voltage is <math>19661/32768 * 5V * 6 = 18V</math>.</p>						

## 13 Timer1

### 13.1 Timer1 Operations

Timer1 consists of a 16-bit up-counting Basic Timer and a 16-bit up counting Reload Timer. Timer1 can be used in the applications of square-wave controlled BLDC motor drive. Timer1 features as follows.

- The 16-bit up counting Basic Timer is used to record the time between two position detected events or two phases commutations (60 degree time) and also can be used for forced commutation control when phase detection fails.
- The 16-bit up counting Reload Timer is used to control the time from position detected to phase commutation, as well as masking time for diode freewheeling, in which position detection is disabled
- The 3-bit programmable frequency prescaler divides the system clock. The divided clock is used as the clock source of the two counters
- Configurable filtering signals and sampling delay for position detection
- Position detection module generates the position signal required for phase commutation according to the input signal
- 7 groups state register control comparator and pre-driver output
- 6 interrupt sources

The internal structure of Timer1 is shown in Figure 13-1.

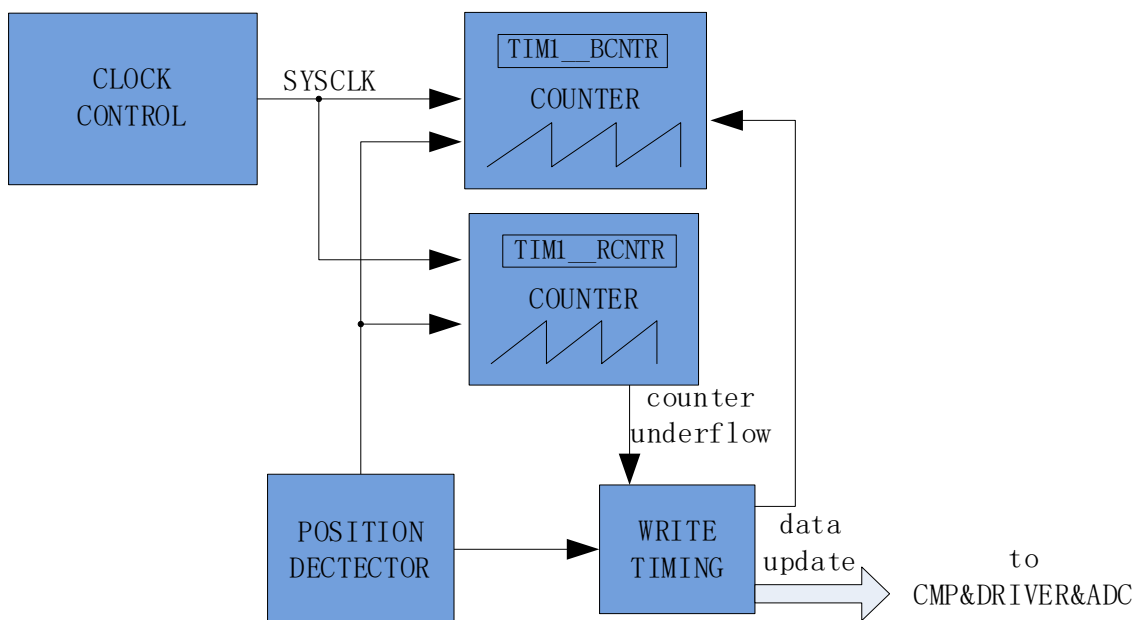

Figure 13-1 Internal Structure of Timer1

**13.1.1 Timer1 Counter Module**

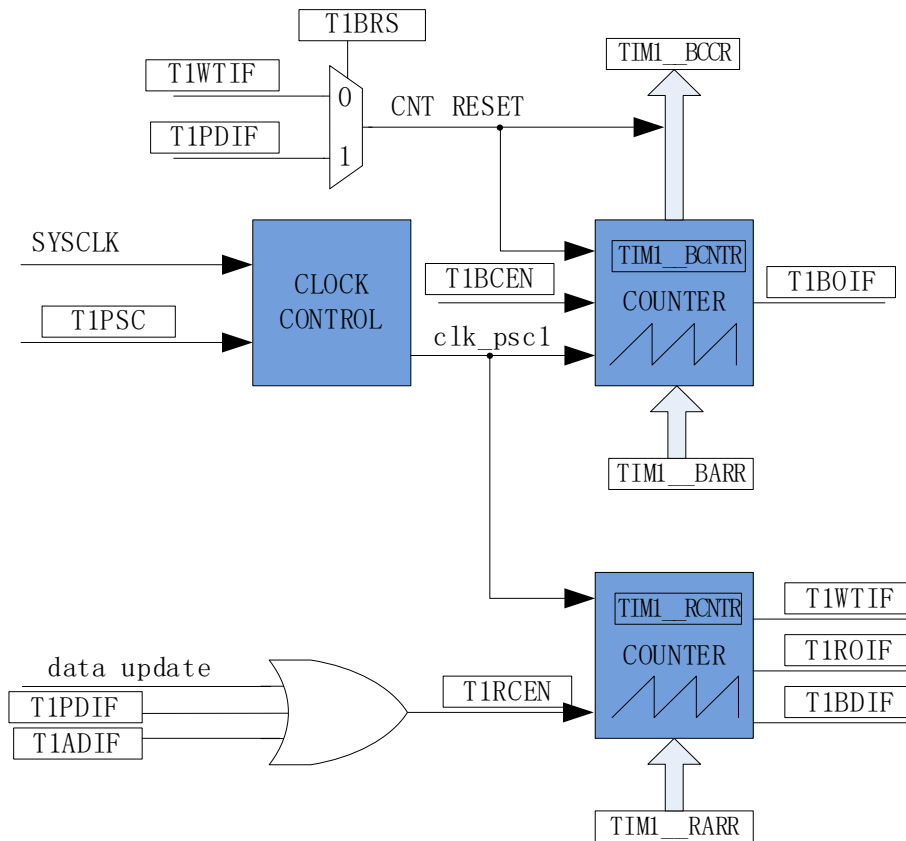

Figure 13-2 Timer Counting Units

Timer1 consists of a frequency prescaler, an 16-bit up-counting Base Timer and an 16-bit up-counting Reload Timer.

**13.1.1.1 Prescaler**

Prescaler is used to divide the system clock frequency and generate clock source for Basic Timer and Reload Timer. It offers 8 division coefficients and can be selected with TIM1\_CR3[T1PSC]. Since this register has no buffer, the clock rate is immediately updated after the division coefficient is written. Therefore, the division coefficient shall be configured when both the Basic Timer and Reload Timer are not working. The clock rate  $clk\_psc1 = SYSCLK / (2^{T1PSC})$ . The clock rate corresponding to TIM1\_CR3[T1PSC] is shown in Table 13-1.

Table 13-1 Mapping between Clock Rate and TIM1\_CR3[T1PSC]

TIM1_CR3[T1PSC]	Coefficient	clk_psc1(Hz)	TIM1_CR3[T1PSC]	Coefficient	clk_psc1(Hz)
000	1	24M	100	16	1.5M
001	2	12M	101	32	750k
010	4	6M	110	64	375k
011	8	3M	111	128	187.5k

**13.1.1.2 Basic Timer**

The Basic Timer is a 16-bit up counter with its count value held in the TIM1\_BCNTNTR register. TIM1\_BCNTNTR value is loaded into Capture Register TIM1\_BCCCR upon a Position Detection Interrupt TIM1\_SR[T1PDIF] or a Write Timing Interrupt TIM1\_SR[T1WTIF] (selected by TIM1\_CR2[T1BRS] bit). Meanwhile, TIM1\_BCNTNTR bit is cleared to 0 and restarts the counter cycle. TIM1\_BCCCR captures the time between two position detection interrupts or two write timing interrupts, i.e. 60° commutation time. These time inputs are averaged multiple times (programmed by the TIM1\_CR0[T1CFLT] bit) before loading the average as a 60° commutation base into the TIM1\_BCOR register. When TIM1\_BARR auto load feature is enabled (TIM1\_CR1[BAPE] is set to 1), TIM1\_BARR loads the value of TIM1\_BCOR by hardware. When count value of TIM1\_BCNTNTR increases to TIM1\_BARR, overflow interrupt flag TIM1\_SR[T1BOIF] of the Basic Timer is set to 1. If forced commutation feature is enabled, phase commutation occurs and the Basic Timer Register is cleared to 0. Otherwise, the Basic Timer Register will not be cleared until it counts up to 0xFFFF and becomes overflowed.

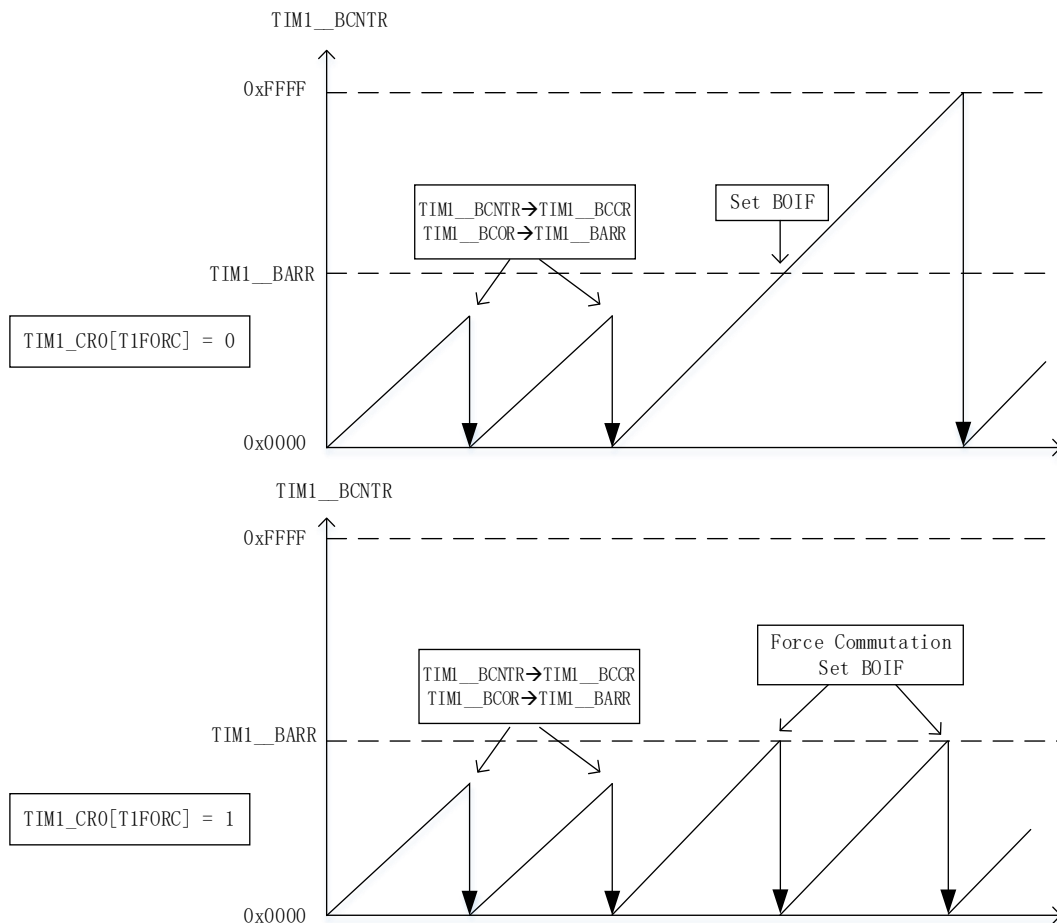

Figure 13-3 Waveform of Basic Timer

In Manual mode (TIM1\_IER[T1MAME] = 1), TIM1\_BCNTNTR is cleared by Basic Timer overflow event instead of TIM1\_CR2[T1BRS].

### 13.1.1.3 Reload Timer

The reload timer is a 16-bit up counter with its count value held in TIM1\_\_RCNTR register. The timer overflows when TIM1\_\_RCNTR increases to TIM1\_\_RARR. It stops counting when TIM1\_SR[T1ROIF] (overflow interrupt flag of the reload counter) is set to 1, and TIM1\_\_RCNTR and TIM1\_CR0[T1RCEN] are cleared to 0. TIM1\_CR0[T1RCEN] is set to 1 to restart reload timer when position detection interrupt or write timing interrupt is generated.

Figure 13-4 Waveform of Reload Timer

### 13.1.2 Position Detection

#### 13.1.2.1 Position Detection Signal

TIM1\_CR3[T1TIS] bit selects the source of position detection signal, including CMP0/1/2 (CMP based position detection), GPIO (Hall effected position detection) or ADC (ADC based position detection). The CMP\_CR1[HALLSEL] bit is used to configure GPIO sourced by P1.4/P1.6/P2.1 (after functional switching) or P3.7. The TIM1\_CR3[T1INM] bit decides whether the CMP/GPIO signal is filtered. A Position Detection Interrupt is generated upon the completion of position detection. Position Detection Interrupts are divided into CMP/GPIO Position Detection Interrupt and ADC Position Detection Interrupt.

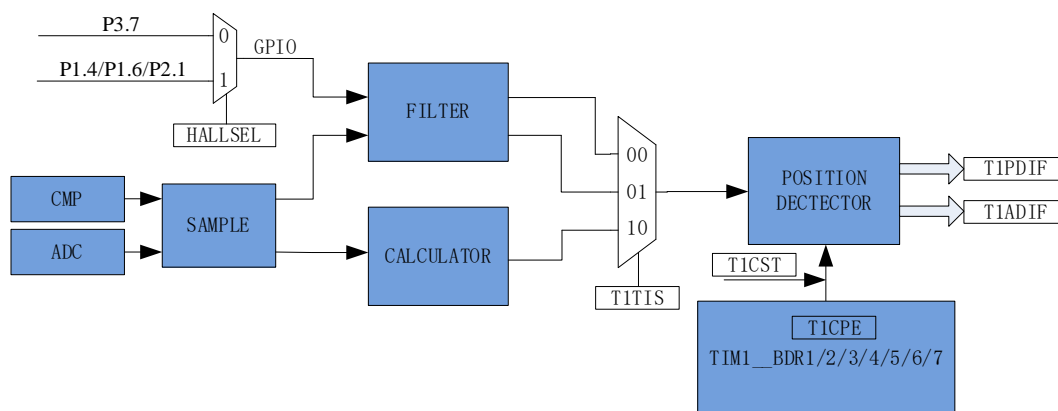

Figure 13-5 Functional Block Diagram of Position Detection

#### 13.1.2.2 CMP/GPIO Position Detection Event

The register bank TIM1\_DBR1/2/3/4/5/6/7[TICPE] is configured to select the active edge of position detection

signal. When an active edge of CMP/GPIO position detection signal is detected, it indicates the position detection is successfully done, allowing CMP/GPIO Position Detection Interrupt Flag TIM1\_SR[T1PDIF] bit to become logic 1. TIM1\_CR4[T1CST] bit selects TIM1\_DBR1/2/3/4/5/6/7[T1CPE] timing.

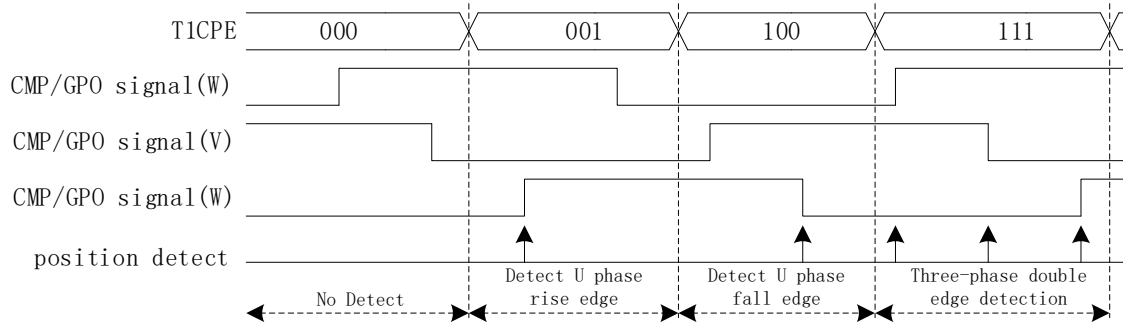

Figure 13-6 Timing Diagram of CMP/GPIO Position Detection

The relation between active edge and TIM1\_DBR1/2/3/4/5/6/7[T1CPE] is shown in Table 13-2.

Table 13-2 Mapping between Active Edge and TIM1\_DBR1/2/3/4/5/6/7[T1CPE]

T1CPE	Description	T1CPE	Description
000	0	100	U-phase corresponding comparator is enabled when falling edge of U-phase is detected.
001	U-phase corresponding comparator is enabled when rising edge of U-phase is detected.	101	W-phase corresponding comparator is enabled when rising edge of W-phase is detected.
010	W-phase corresponding comparator is enabled when falling edge of W-phase is detected.	110	V-phase corresponding comparator is enabled when falling edge of V-phase is detected.
011	V-phase corresponding comparator is enabled when rising edge of V-phase is detected.	111	U+W+V-phase corresponding comparator is enabled when rising falling edge of U+W+V-phase is detected.

### 13.1.2.3 ADC Position Detection Event

TIM1\_CR3[T1TIS] is configured to select the position detection signal from ADC. Timer1 controls ADC to sample the voltage of active phase and floating phase. To get the position information, which are calculated as the following equation:

$$TIM1\_URES = K \times TIM1\_UCOP - TIM1\_UFLP$$

where,

*K*: ADC position detection factor

TIM1\_\_UCOP: ADC sampling value of active phase

TIM1\_\_UFLP: ADC sampling value of floating phase

*K*, TIM1\_\_UCOP and TIM1\_\_UFLP are determined by TIM1\_DBR1/2/3/4/5/6/7[T1CPE] bit, as detailed in Table 13-3.

Table 13-3 Relation between TIM1\_DBR1/2/3/4/5/6/7[T1CPE] and K, TIM1\_\_UCOP, TIM1\_\_UFLP

CPE	Description
000	Reserved
001	TIM1_KR for K, W-phase voltage for TIM1__UCOP, and U-phase voltage for TIM1__UFLP
010	TIM1_KF for K, U-phase voltage for TIM1__UCOP, and W-phase voltage for TIM1__UFLP
011	TIM1__KR for K, U-phase voltage for TIM1__UCOP, and V-phase voltage for TIM1__UFLP
100	TIM1_KR for K, V-phase voltage for TIM1__UCOP, and U-phase voltage for TIM1__UFLP
101	TIM1_KR for K, V-phase voltage for TIM1__UCOP, and W-phase voltage for TIM1__UFLP
110	TIM1_KF for K, W-phase voltage for TIM1__UCOP, and V-phase voltage for TIM1__UFLP
111	Reserved

When TIM1\_\_URES has a negative step or a positive step, ADC position detected event is generated and TIM1\_SR[T1ADIF] (ADC position detection interrupt flag) is set to 1. The position at which ADC Position Detection Interrupt is generated is controlled by setting the coefficient K. In this case, the phase commutation degree can be controlled flexibly.

### 13.1.2.4 Sampling

Figure 13-7 Timing Diagram of Sampling

Affected by switching rate of the power device, BEMF signal lags behind PWM output. CMP\_SAMR[CSOFFD], CMP\_SAMR [CSOND] and CMP\_CR4[FAEN] shall be set reasonably to adjust the sampling interval and obtain the valid position detection signal. When TIM1\_CR3[T1TIS] = 01 or 10, Timer1 enables CMP0/1/2 to output the compare results between phase BEMF and neutral point, or starts ADC module to sample floating voltage.

See section 27.1.4 for more details.

**13.1.2.5 Filtering**

Figure 13-8 Timing Diagram of Filtering Module

According to TIM1\_CR3[T1INM] and CMP\_CR4[FAEN], the filtered pulse width of input noise can be selected as 8/16/24/32/64/96 system clock. After this feature is enabled, the signal is lagged behind about 8/16/24/32/64/96 system clock.

**13.1.3 Writing Sequence Event**

Figure 13-9 Block Diagram of Writing Sequence

When the control logic, predefined in TIM1\_DBR1/2/3/4/5/6/7, is sent to driver register DRV\_CMR, a writing sequence interrupt is generated. The triggered source is selected by the configuration of TIM1\_CR0[TIOPS], and the software, Reload Timer overflow event or position detected event can be selected. When a writing sequence interrupt is generated, writing sequence interrupt flag is set to 1. If TIM1\_CR4[T1CST] is in 001 ~ 110, TIM1\_CR4[T1CST] adds 1 automatically.

**13.1.4 Timer1 Interrupt**

Timer1 has 6 interrupt sources:

- Base Timer overflow interrupt
- Reload Timer overflow interrupt
- Writing sequence interrupt
- Diode freewheeling end interrupt
- CMP/GPIO position detection interrupt
- ADC position detected interrupt

Figure 13-10 Timer1 Interrupt Sources

### 13.2 Square Wave Control Based BLDC Motor

For BLDC motor square wave control application, Timer1 works with CMP0/1/2 and Driver module to achieve the following features:

- Automatic record of 60 degree time, filtered as 60 degree reference time
- Automatic forced phase commutation when position signal is not detected
- Automatic diode freewheeling masking, i.e., stopping position detection during diode freewheeling
- Automatic control of the time from position detected to phase commutation to achieve automatic commutation
- Take over CMP\_CR2[CMP0SEL] to control CMP0/1/2 automatically
- Comparator signal can be set to avoid power device switching oscillation for sampling, and the signal can be configured to be filtered after sampling
- Take over DRV\_CMCR register to control 6 PWM outputs automatically

### 13.2.1 Six-step Phase Commutation of Square Wave Control

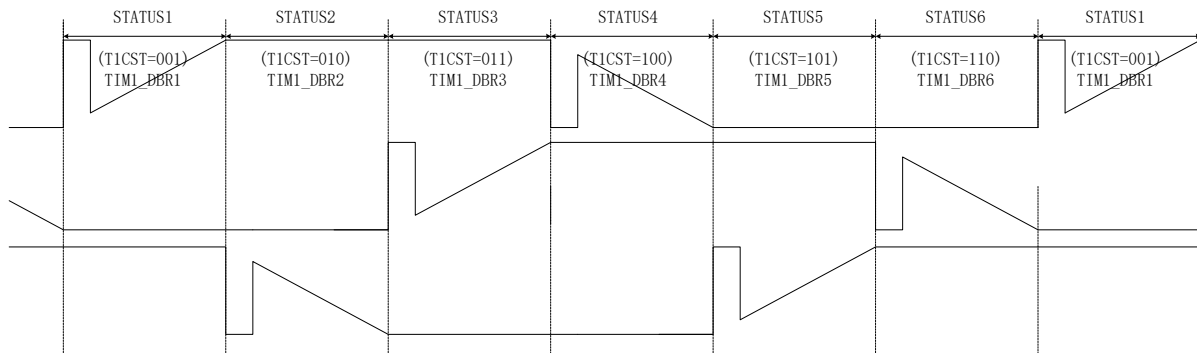

Figure 13-11 Diagram of Six-step Phase Commutation of Square Wave Control

TIM1\_CR4[T1CST] is the commutation state machine. Among them, state 0 is used to output off state, and state 7 is customizable for braking, pre-charging, pre-positioning, startup, etc. States 1 ~ 6 are used for six-step automatic commutation, and the state machine TIM1\_CR4[T1CST] automatically adds 1 after phase commutation.

The states 1~7 maps to the TIM1\_DBR1~7. When writing sequence interrupt occurs, TIM1\_DBRx corresponding to the current state is automatically transferred to DRV\_CMR and CMP\_CR2[CMP0SEL] for phase commutation and position detection.

**13.2.2 Square Wave Control Working Principle**

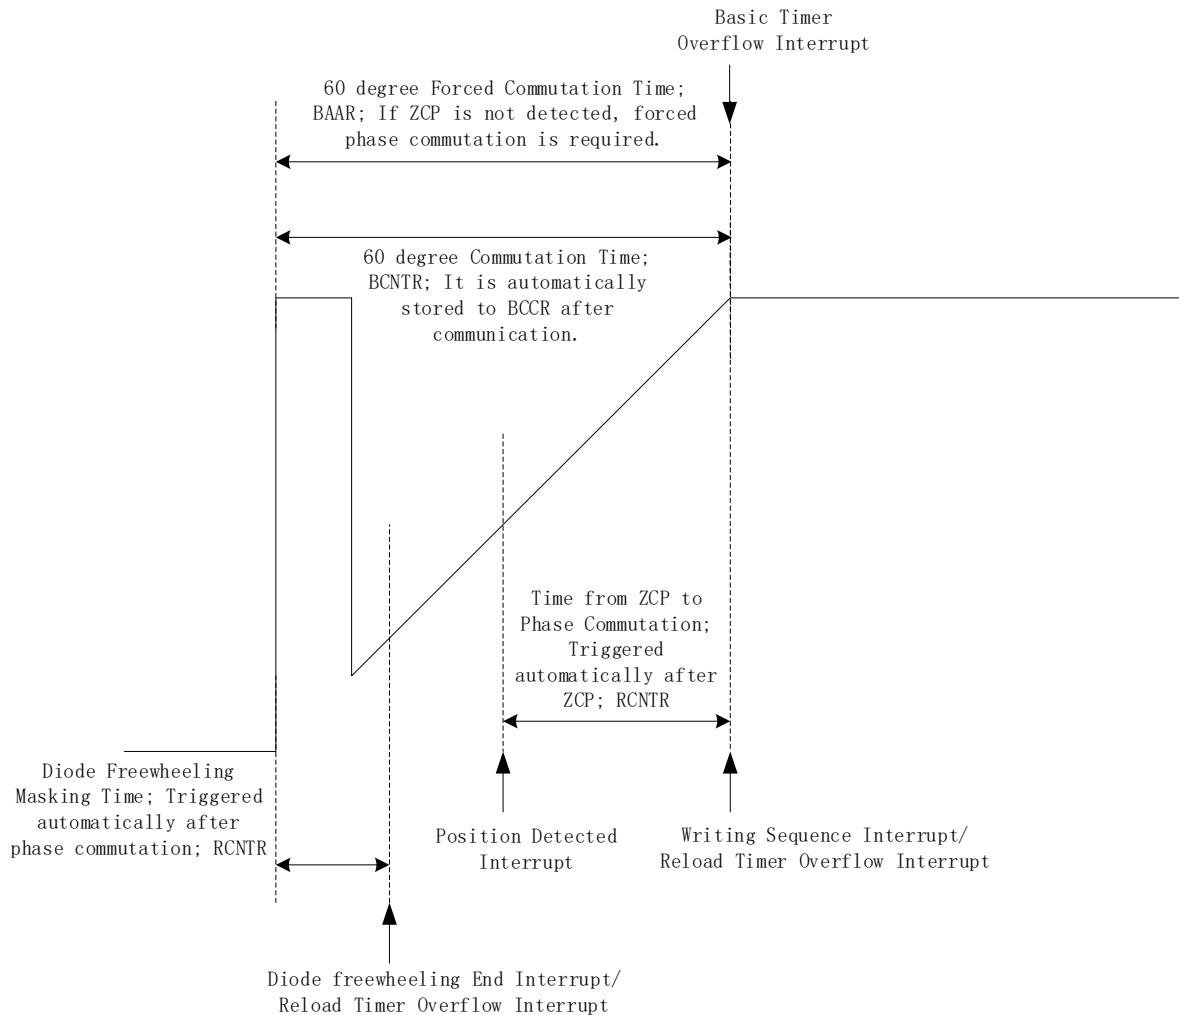

Figure 13-12 Square Wave Control Working Principle

**13.2.2.1 60° Commutation Base Time**

TIM1\_\_BCCR captures the time of last 60 degree. TIM1\_CR2[T1BRS] is set to 0 to capture the time between two writing sequence interrupts and TIM1\_CR2[T1BRS] to 1 to capture the time between two position detected interrupts.

TIM1\_BCOR is the filtered 60 degree time, i.e., 60 degree base time. TIM1\_CR0[CFLT] can select the last 1/2/4/8 TIM1\_\_BCCR averaged to obtain TIM1\_BCOR.

In square wave control mode, the diode freewheeling masking time, the time from position detected to commutation, and the time to forced commutation are determined by the 60 degree base time TIM1\_BCOR.

When base timer is auto-load enabled (TIM1\_CR1[T1BAPE] = 1) and is reset due to a position detection interrupt or a write timing interrupt, TIM1\_BCOR is transferred to TIM1\_\_BARR to control the forced phase commutation.

**13.2.2.2 Forced Commutation at 60°**

When the motor rotates smoothly, ZCP is generally detected after 30 degrees of rotation after a phase commutation

and a position detection interrupt is generated. If ZCP is not detected in 60 degree after the phase commutation, position detection fails and a forced commutation is required. In this case, TIM1\_CR0[FORC] is set to 1 to enable the forced commutation feature. During previous commutation, the counter TIM1\_BCNTR is cleared to 0 by timing interrupt and restarts counting, while TIM1\_BCCR captures the count value held in TIM1\_BCNTR, which is filtered and stored in TIM1\_BCOR as the 60 degree base time. When auto-load feature is enabled (TIM1\_CR1[T1BAPE]= 1), the value held in TIM1\_BCOR is loaded into TIM1\_BARR after the Basic Timer is cleared. If no ZCP is detected in 60 degree after commutation (TIM1\_BCNTR matches TIM1\_BARR), TIM1\_SR[T1BOIF] (overflow interrupt flag of the Basic Timer) is set to 1 for forced phase commutation, and the counter TIM1\_BCNTR is cleared to 0. But if a ZCP is detected within 60 degrees after phase commutation, even when TIM1\_BCNTR > TIM1\_BARR, the forced commutation will not be triggered and TIM1\_SR[T1BOIF] will not be set to 1. When forced commutation feature is disabled (TIM1\_CR0[FORC] = 0) and TIM1\_BCNTR > TIM1\_BARR, the interrupt flag TIM1\_SR[T1BOIF] is set to 1 and no forced phase commutation is automatically performed. Phase commutation can be performed manually by Basic Timer overflow interrupt flag and the position detected interrupt flag.

### 13.2.2.3 Diode Freewheeling Masking

After the commutation, inductance energy of the phase is released to the power supply or ground through the diode since the original active phase becomes a floating phase. During diode freewheeling, the floating phase BEMF signal cannot be measured. By masking comparator signal or ADC sampling value during diode freewheeling, wrong commutation caused by wrong signal generated by the freewheeling is avoided. After freewheeling masking, the freewheeling masking end interrupt flag TIM1\_SR[T1BDIF] is generated.

Freewheeling masking time is set by TIM1\_CR1[BSEL] with the formula: Masking angle =  $TIM1\_CR1[BSEL]/128 * 60^\circ$ .

### 13.2.2.4 Angle of Position Detected to Commutation

After commutation, a ZCP is detected (generating a position detected interrupt) and the hardware starts counting according to the software-set time between ZCP and the commutation. After the counting ends, the hardware automatically implements phase commutation and generates the write sequence interrupt flag TIM1\_SR[T1WTIF].

The time between ZCP and commutation is set by TIM1\_CR2[CSEL] with the formula: Commutation angle =  $TIM1\_CR2[CSEL]/128 * 60^\circ$ .

### 13.2.2.5 Cycle-by-Cycle Current Limiting

See section 27.1.1.2 for cycle-by-cycle current limiting.

### 13.3 Timer1 Registers

#### 13.3.1 TIM1\_CR0 (0x4068)

Bit	7	6	5	4	3	2	1	0
Name	T1RWEN	T1CFLT		T1FORC	T1OPS		T1BCEN	T1RCEN
Type	W1	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	T1RWEN	TIM1_CR0[T1RCEN] Write Enable 0: No effect 1: When TIM1_CR0 is updated, TIM1_CR0[T1RWEN] and TIM1_CR0[T1RCEN] shall be configured simultaneously to enable or disable TIM1_CR0[T1RCEN]. A write of “0x81” to TIM1_CR0 enables TIM1_CR0[T1RCEN] and “0x80” to disable TIM1_CR0[T1RCEN].						
[6:5]	T1CFLT	60 Degree Base Time Filtering Selection The average of previous x times 60 degree is used as the base time 00: 1 times 60 degree 01: 2 times 60 degree 10: 4 times 60 degree 11: 8 times 60 degree						
[4]	T1FORC	Forced Phase Commutation at 60° Enable 0: Disable 1: Enable  Note: If a ZCP is detected, forced phase commutation will not be implemented even if this bit is enabled.						
[3:2]	T1OPS	Phase Commutation Trigger Signal Selection Select the trigger signal for TIM1_DBRx to transfer data to DRV_CMR. 00: The transfer is triggered upon a write of “1” to TIM1_IER[T1UPD] in software or on a write to TIM1_CR4[T1CST]. 01: The transfer is triggered upon an overflow interrupt of reload timer commutation counter 10: The transfer is triggered upon a Position Detected Interrupt 11: Reserved						
[1]	T1BCEN	Base Timer Enable 0: Disable 1: Enable						
[0]	T1RCEN	Reload Timer Enable When TIM1_CR0 is updated, TIM1_CR0[T1RWEN] and TIM1_CR0[T1RCEN] must be configured simultaneously to enable or disable TIM1_CR0[T1RCEN]. 0x81 is written to TIM1_CR0 to enable TIM1_CR0[T1RCEN] and 0x80 to disable TIM1_CR0[T1RCEN]. TIM1_CR0[T1RCEN] can be enabled by position detected interrupt and writing sequence interrupt. TIM1_CR0[T1RCEN] is cleared to 0 by hardware when the Reload Timer overflow interrupt is generated. In manual mode, TIM1_CR0[T1RCEN] cannot be automatically enabled or disabled by hardware. 0: Disable 1: Enable						

**13.3.2 TIM1\_CR1 (0x4069)**

Bit	7	6	5	4	3	2	1	0
Name	T1BAPE	BSEL						
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	T1BAPE	TIM1_BARR Auto-load Enable With this bit enabled, TIM1_BCOR is written to TIM1_BARR when Basic Timer is cleared due to a position detected event or a writing sequence event. It is used for forced phase commutation at 60° when no ZCP is detected. Setting the device in Manual mode has no effect on TIM1_BARR Register auto-load feature. 0: Disable 1: Enable						
[6:0]	BSEL	Diode Freewheeling Masking Angle Selection Angle of diode freewheeling masking after phase commutation. During diode freewheeling masking, the position is not detected Diode freewheeling angle = $TIM1\_CR1[BSEL]/128 \times 60^\circ$  Note: In manual mode, this bit is invalid						

**13.3.3 TIM1\_CR2 (0x406A)**

Bit	7	6	5	4	3	2	1	0
Name	T1BRS	CSEL						
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	T1BRS	Base Timer Reset Source Selection In manual mode, this bit is invalid, and TIM1_BCNTTR can only be cleared by a BCNTR overflow interrupt. 0: Writing sequence interrupt 1: Position detected interrupt						
[6:0]	CSEL	Phase Commutation Angle Selection After a position detected event, phase commutation is implemented after the degree configured by TIM1_CR2[CSEL]. Commutation angle = $TIM1\_CR2[CSEL]/128 \times 60^\circ$						

**13.3.4 TIM1\_CR3 (0x406B)**

Bit	7	6	5	4	3	2	1	0
Name	RSV	T1PSC			T1TIS		T1INM	
Type	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	0	0	0	0	1	0	0
Bit	Name	Description						
[7]	RSV	Reserved						
[6:4]	T1PSC	Timer Clock Source Frequency Selection This bit is used to divide the system clock as the clock source for Basic Timer and Reload Timer. The clock source frequency of the two timers: 000: 24MHz                      001: 12MHz 010: 6MHz                        011: 3MHz 100: 1.5MHz                      101: 750kHz 110: 375kHz                       111: 187.5kHz						

[3:2]	T1TIS	Position Detection Signal Selection 00: GPIO (select P1.4, P1.6, P2.1 or P3.7 by CMP_CR1[HALLSEL]) 01: Output signal of CMP0/1/2 10: Output signal of ADC 11: Reserved
[1:0]	T1INM	Filtering Pulse Width of the Position Detection Signal Selection. When pulse width of the input signal is less than the set value, it is filtered as noise. The filtering time is multiplied by 4 times according to CMP_CR4[FAEN]. When CMP_CR4[FAEN] = 0: 00: No filtering 01: 8 system clock cycles 10: 16 system clock cycles 11: 24 system clock cycles When CMP_CR4[FAEN]= 1: 00: No filtering 01: 32 system clock cycles 10: 64 system clock cycles 11: 96 system clock cycles

### 13.3.5 TIM1\_CR4 (0x406C)

Bit	7	6	5	4	3	2	1	0	
Name	RSV					T1CST			
Type	—	—	—	—	—	R/W	R/W	R/W	
Reset	—	—	—	—	—	0	0	0	
Bit	Name	Description							
[7:3]	RSV	Reserved							
[2:0]	T1CST	Phase Commutation State Machine The state machine corresponds to different TIM1_DBRx at different states When TIM1_CR4[T1CST] reads 001 ~ 111, Timer1 automatically enables or disables CMP0/1/2 according to TIM1_DBRx[T1CPE]. When TIM1_CR4[T1CST] reads 001 ~ 110, Timer1 automatically adds 1 each cycle upon a Write Timing Interrupt.  Table 13-4 Mapping between TIM1_CR4[T1CST] and TIM1_DBRx							
			<b>TIM1_CR4[T1CST]</b>	<b>TIM1_DBRx</b>	<b>TIM1_CR4[T1CST]</b>	<b>TIM1_DBRx</b>			
			000	0	100	TIM1_DBR4			
			001	TIM1_DBR1	101	TIM1_DBR5			
			010	TIM1_DBR2	110	TIM1_DBR6			
			011	TIM1_DBR3	111	TIM1_DBR7			

### 13.3.6 TIM1\_IER (0x406D)

Bit	7	6	5	4	3	2	1	0	
Name	T1UPD	T1MAME	T1ADIE	T1BOIE	T1RUIE	T1WTIE	T1PDIE	T1BDIE	
Type	W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0	0	
Bit	Name	Description							
[7]	T1UPD	When TIM1_CR0[T1OPS]=00, a write of“1”to this bit enables data transfer. This bit is cleared to “0” by hardware after 1 is written.							
[6]	T1MAME	Manual Mode Enable With this bit enabled, Basic Timer and Reload Timer acts as separate counters. The details are: TIM1__BCNTR of the Basic Timer is cleared by counter overflow interrupt instead of TIM1_CR2[T1BRS] TIM1_CR0[T1RCEN] of the Reload Timer cannot be cleared to 0 or set to 1 automatically, and is operated by software only. TIM1_RCNTR of the Reload Timer can be cleared to 0 upon a Reload Timer							

		overflow Interrupt only. TIM1__RARR of the Reload Timer cannot be updated automatically, and is operated by software only. 0: Disable 1: Enable
[5]	T1ADIE	ADC Position Detected Interrupt Enable 0: Disable 1: Enable
[4]	T1BOIE	Base Timer Overflow Interrupt Enable 0: Disable 1: Enable
[3]	T1ROIE	Reload Timer Overflow Interrupt Enable 0: Disable 1: Enable
[2]	T1WTIE	Writing Sequence Interrupt Enable 0: Disable 1: Enable
[1]	T1PDIE	CMP/GPIO Position Detected Interrupt Enable 0: Disable 1: Enable
[0]	T1BDIE	Diode Freewheeling End Interrupt Enable 0: Disable 1: Enable

### 13.3.7 TIM1\_SR (0x406E)

Bit	7	6	5	4	3	2	1	0
Name	RSV		T1ADIF	T1BOIF	T1ROIF	T1WTIF	T1PDIF	T1BDIF
Type	—	—	R/W0	R/W0	R/W0	R/W	R/W0	R/W0
Reset	—	—	0	0	0	0	0	0

Bit	Name	Description
[7:6]	RSV	Reserved
[5]	T1ADIF	ADC Position Detected Interrupt Event Flag A position detected interrupt is generated when ADC position detection signal is matched with TIM1_DBRx[T1CPE]. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[4]	T1BOIF	Base Timer Overflow Interrupt Flag An overflow event occurs when Basic Timer counts up and TIM1_BCNTNTR matches with TIM1_BARR. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[3]	T1ROIF	Reload Timer Overflow Interrupt Flag An overflow event occurs and TIM1__RCNTR is cleared to 0 when TIM1__RCNTR matches TIM1__RARR. Read: 0: No interrupt pending

		1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[2]	T1WTIF	Writing Sequence Interrupt Flag Writing sequence interrupt is generated when TIM1_DBRx is transferred to DRV_CMCR. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[1]	T1PDIF	CMP/GPIO Position Detected Interrupt Flag A position detected interrupt is generated when CMP/GPIO position detection signal is matched with TIM1_DBRx[T1CPE]. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[0]	T1BDIF	Diode Freewheeling End Interrupt Flag Diode freewheeling starts after phase commutation and an interrupt is generated at end. Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect

### 13.3.8 TIM1\_\_BCOR (0x4070, 0x4071)

TIM1__BCORH(0x4070)								
Bit	15	14	13	12	11	10	9	8
Name	TIM1__BCOR[15:8]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
TIM1__BCORL(0x4071)								
Bit	7	6	5	4	3	2	1	0
Name	TIM1__BCOR[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name		Description					
[15:0]	TIM1__BCOR		The bit is configured to capture filtered count values held in the Base Timer. TIM1_BCCR holds the filtering value (i.e., 60 degree base time).					

**13.3.9 TIM1\_DBR1 (0x4074, 0x4075)**

TIM1_DBR1H(0x4074)								
Bit	15	14	13	12	11	10	9	8
Name	RSV	T1CPE			T1WHP	T1WLP	T1VHP	T1VLP
Type	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	0	0	0	0	0	0	0
TIM1_DBR1L(0x4075)								
Bit	7	6	5	4	3	2	1	0
Name	T1UHP	T1ULP	T1WHE	T1WLE	T1VHE	T1VLE	T1UHE	T1ULE
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[15]	RSV	Reserved						
[14:12]	T1CPE	Position Detection Signal Input Edge Polarity and Comparator Enable Selection These bits are used to define the edge of the position detection input signal and enable or disable the corresponding comparator. The detected edge in input signal, corresponding to the configuration, generates a position detected interrupt. Refer to CMP/GPIO Position Detection Event and Table 13-2						
[11]	T1WHP	High-side Output Polarity of W-phase 0: Active High 1: Active Low						
[10]	T1WLP	Low-side Output Polarity of W-phase 0: Active High 1: Active Low						
[9]	T1VHP	High-side Output Polarity of V-phase 0: Active High 1: Active Low						
[8]	T1VLP	Low-side output polarity of V-phase 0: Active High 1: Active Low						
[7]	T1UHP	High-side Output Polarity of U-phase 0: Active High 1: Active Low						
[6]	T1ULP	Low-side Output Polarity of U-phase 0: Active High 1: Active Low						
[5]	T1WHE	High-side Output Enable of W-phase 0: Disable 1: Enable						
[4]	T1WLE	Low-side Output Enable of W-phase 0: Disable 1: Enable						
[3]	T1VHE	High-side Output Enable of V-phase 0: Disable 1: Enable						
[2]	T1VLE	Low-side Output Enable of V-phase 0: Disable 1: Enable						
[1]	T1UHE	High-side Output Enable of U-phase 0: Disable 1: Enable						
[0]	T1ULE	Low-side Output Enable of U-phase 0: Disable 1: Enable						

Note: When TIM1\_DBR1[T1WLE] and TIM1\_DBR1[T1WHE], TIM1\_DBR1[T1VLE] and TIM1\_DBR1[T1VHE] or TIM1\_DBR1[T1ULE] and TIM1\_DBR1[T1UHE] are set to “1” at the same time, the 3-phase high side and low side

of bridges are complementary output and the deadtime is automatically inserted.

### 13.3.10 TIM1\_DBR2 (0x4076, 0x4077)

Name	TIM1__ITRIP[7:0]							
Type	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[15:0]	TIM1__ITRIP	Filtered Bus Current When DRV__CNTR = 0, the hardware module automatically samples the bus current and filters it for software using. The default channel is ADC channel 4 Range [0,32767] Note: This value is obtained by averaging the instantaneous current values of 8 samples

## 14 Timer2

### 14.1 Timer2 Instructions

Timer2 has 5 working modes:

- Output mode: PWM generation
- Input capture mode: Detect the duration of high and low level of input PWM
- Input counter mode: Detect the time of set PWM wave numbers
- QEP & RSD mode: Quadrature Encoder Pulse & Rotating State Detection (tailwind/headwind detection) mode
- Step mode: Detect rotation direction, position and speed of the step motor

Timer2 features:

- 3-bit programmable prescaler divides the system clock
- 16-bit up counting Basic Timer; Counting clock source serves as the output of prescaler
- 16-bit up/down-counting special counter for input counter mode, QEP & RSD mode and step mode, with external input signal selected as clock source.
- Input filter module
- Edge detection module

- Interrupt event

#### 14.1.1 Prescaler

Frequency prescaler is used to divide the system clock and generate clock source for Basic Timer. 8 frequency division coefficients of prescaler are available and can be selected by TIM2\_CR0[T2PSC]. Since this register has no buffer, the clock source frequency is updated immediately after TIM2\_CR0[T2PSC] is written. Therefore, the frequency division coefficients shall be configured when Basic Timer is not working. The clock source frequency formula is:  $clk\_psc2 = SYSCLK / (2^{TIM2\_CR0[T2PSC]})$ . The clock rate corresponding to different TIM2\_CR0[T2PSC] value as shown in Table 14-1.

Table 14-1 Mapping between Clock rate and TIM2\_CR0[T2PSC]

TIM2_CR0[T2PSC]	Coefficient	clk_psc2 (Hz)	TIM2_CR0[T2PSC]	Coefficient	clk_psc2 (Hz)
000	1	24M	100	16	1.5M
001	2	12M	101	32	750K
010	4	6M	110	64	375K
011	8	3M	111	128	187.5K

#### 14.1.2 Reading, Writing and Counting of TIM2\_CNTR

When TIM2\_CR1[T2CEN] = 1, TIM2\_CNTR starts to count. The write operation to TIM2\_CNTR directly

changes the value of the register, so Basic Timer shall be disabled before the write operation. When reading TIM2\_\_CNTR, software reads the 8 high-order bits first, and the hardware synchronously caches the 8 low-order bits. When reading the low byte, software reads the cached data.

**14.1.3 Output Mode**

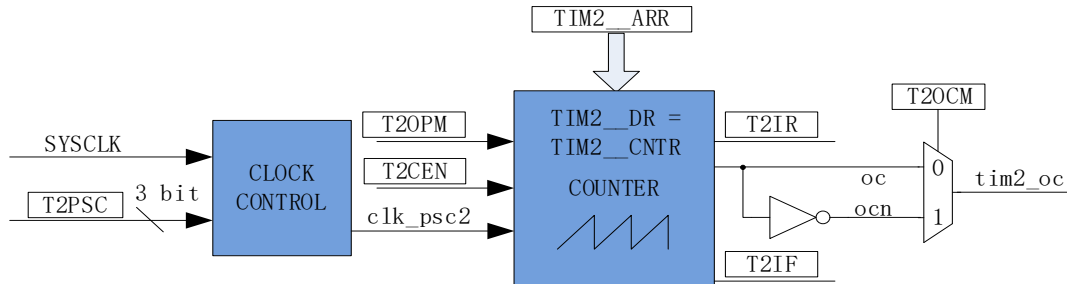

Figure 14-1 Schematic Block Diagram of Output Mode

The output mode generates output signals according to TIM2\_CR0[T2OCM], and the comparison results between TIM2\_\_CNTR and registers TIM2\_\_DR, TIM2\_\_ARR. Meanwhile, corresponding interrupts are generated.

**14.1.3.1 Reading and Writing of TIM2\_\_ARR/TIM2\_\_DR**

In output mode, TIM2\_\_ARR/TIM2\_\_DR contains preload registers and shadow registers. When the software writes TIM2\_\_ARR/TIM2\_\_DR register, the data is saved in the preload register. When the overflow event TIM2\_CR1[T2IF] is generated or the Basic Timer stops working (TIM2\_CR1[T2CEN] = 0), the set value is transferred to the shadow register.

TIM2\_\_ARR/TIM2\_\_DR is a 16-bit register, which requires to write the high byte first and then the low byte. The hardware ensures that the data in preload register is not transferred to shadow register after the high byte is written and before the low byte is written.

For example, TIM2\_\_DR is a preload register and DR\_SH is a shadow register. PWM is generated by comparing TIM2\_\_CNTR with DR\_SH. When software writes TIM2\_\_DR, TIM2\_\_DR is not updated to DR\_SH immediately, and is updated to TIM2\_\_DR at the end of a PWM (TIM2\_\_CNTR overflow event).

**14.1.3.2 High/Low Level Output**

When TIM2\_CR0[T2OCM] = 0, if TIM2\_\_DR > TIM2\_\_ARR, the output signal is always low. When TIM2\_CR0[T2OCM] = 1, if TIM2\_\_DR > TIM2\_\_ARR, the output signal is always high.

**14.1.3.3 PWM Generation**

In PWM generation mode, TIM2\_\_ARR determines PWM cycle, TIM2\_\_DR determines duty cycle, and duty cycle =  $TIM2\_DR / TIM2\_ARR * 100\%$ . If TIM2\_CR0[T2OCM] = 0, the low level is output when  $TIM2\_CNTR < TIM2\_DR$ , and the high level is output when  $TIM2\_CNTR \geq TIM2\_DR$ . If TIM2\_CR0[T2OCM] = 1, the high level is output when  $TIM2\_CNTR < TIM2\_DR$ , and the low level is output when  $TIM2\_CNTR \geq TIM2\_DR$ . When

TIM2\_\_CNTR is increased to TIM2\_\_ARR, the output signal is reversed.

**14.1.3.4 Interrupt Event**

- When TIM2\_\_CNTR = TIM2\_\_DR, a compare match event is generated and the interrupt flag bit TIM2\_CR1[T2IR] is set to 1. The timer continues
- When TIM2\_\_CNTR = TIM2\_\_ARR, an overflow event is generated, and the interrupt flag bit TIM2\_CR1[T2IF] is set to 1. The timer is cleared to 0 and the restarts.

Figure 14-2 Output Mode Waveform

**14.1.4 Input Signal Filtering and Edge Detection**

Figure 14-3 Block Diagram of Input Signal Filtering and Edge Detection

The input signal of Timer2 comes from P0.7 or P1.0, set by PH\_SEL[T2SEL] and PH\_SEL [T2SSEL] (see section 20.3.12). The filter of input signal is optional.

The filtering feature is enabled when TIM2\_CR1[T2\_FE] is set to 1, and filtering circuit filters out the input noise below 4 system clock cycles. The filtered signal is 4 clock cycles later than the signal before filtering. TIM2\_CR0[T2CES] determines the active edge to count.

Figure 14-4 Timing Diagram of Filter Module

The edge detection module detects filtered input signals and records rising edge and falling edge for the input capture mode or input counting mode.

### 14.1.5 Input Capture Mode

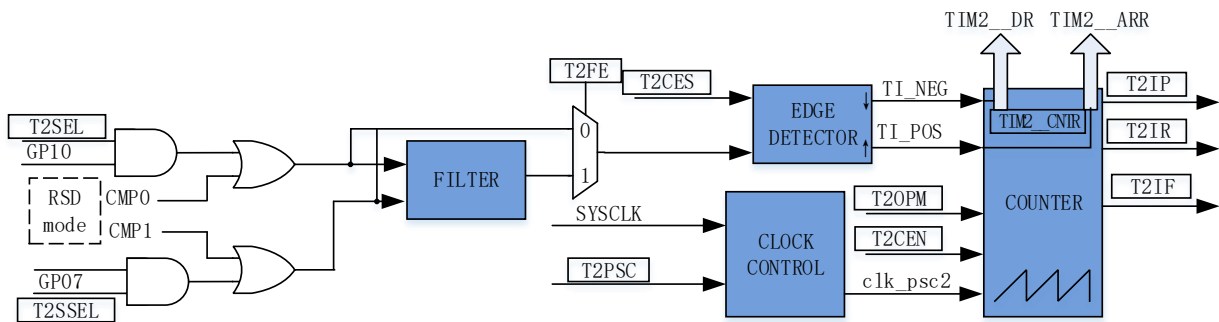

Figure 14-5 Schematic Block Diagram of Input Capture Mode

The input capture mode detects duty cycle and period of the PWM signal. When  $TIM\_CR0[T2CES] = 0$ , the time between two adjacent rising edges forms one cycle, and the time from rising edge to falling edge forms the pulse width (HIGH). When  $TIM\_CR0[T2CES] = 1$ , the time between two adjacent falling edges forms one cycle, and the time from falling edge to rising edge forms the pulse width (LOW). When the predefined edge arrives, the count value  $TIM2\_CNTR$  is stored in  $TIM2\_DR$  and  $TIM2\_ARR$  respectively to calculate the period and duty cycle of PWM waveform. The input signal can be filtered or not.

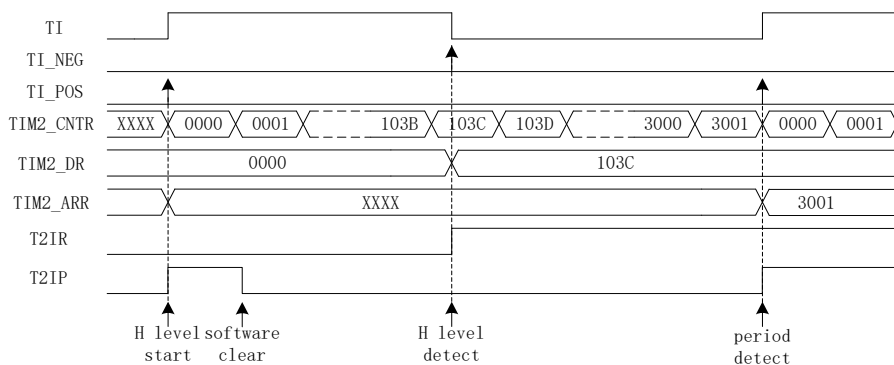

Figure 14-6 Timing Diagram of Input Capture Mode ( $T2CES = 0$ )

For example, when  $T2CES = 0$ ,  $TIM2\_CR1[T2CEN]$  is set to 1 to enable the counter. When the first rising edge of the input (falling edge is invalid) is detected,  $TIM2\_CNTR$  is cleared and restarts. When falling edge of the input is detected, the value of  $TIM2\_CNTR$  is stored in  $TIM2\_DR$ , while the interrupt flag  $TIM2\_CR1[T2IR]$  is set to 1, and  $TIM2\_CNTR$  continues to count. When the second rising edge of input is detected, the value of  $TIM2\_CNTR$  is stored in  $TIM2\_ARR$ . Meanwhile, the interrupt flag  $TIM2\_CR1[T2IP]$  is set to 1, and  $TIM2\_CNTR$  is cleared to 0 and restarts.

An overflow event occurs if Timer2 does not detect the second rising edge of the input and  $TIM2\_CNTR$  reaches  $0xFFFF$ . In this case, the interrupt flag bit  $TIM2\_CR1[T2IF]$  is set to 1, and  $TIM2\_CNTR$  is cleared to 0 and restarts counting..

### 14.1.6 Input Counter Mode

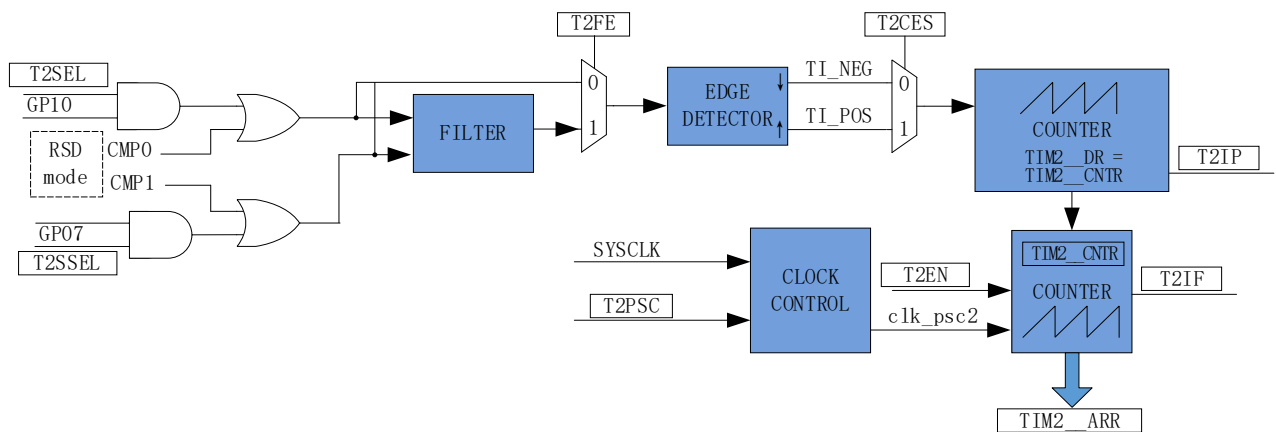

Figure 14-7 Schematic Block Diagram of Input Counter Mode

In input counter mode,  $TIM2\_DR$  includes preload register and shadow register. When the software writes  $TIM2\_DR$  register, the data is saved in the preload register first and sent to the shadow register in case of compare match event ( $TIM2\_CR1[T2IP] = 1$ ), overflow event ( $TIM2\_CR1[T2IF] = 1$ ) or counter disable ( $TIM2\_CR1[T2CEN] = 0$ ).  $TIM2\_DR$  is a 16-bit register, which requires the software writes the high byte first and then the low byte. The hardware ensures that the data in the preload register is not updated to the shadow register after the high byte is written and before the low byte is written.

The input counter mode is used to detect the time to input the set PWM wave. When the number of input PWM counted by the special counter  $CCNTR$  reaches the set value ( $TIM2\_DR$ ),  $TIM2\_CNTR$  of the Basic Timer is stored in  $TIM2\_ARR$ . The input signal can be filtered or not. When  $TIM2\_CR0[T2CES]$  is set to 1, rising edge of the input PWM signal serves as the active counting edge of the special counter; when  $TIM2\_CR0[T2CES]$  is set to 0, falling edge of the input PWM signal as the active counting edge.

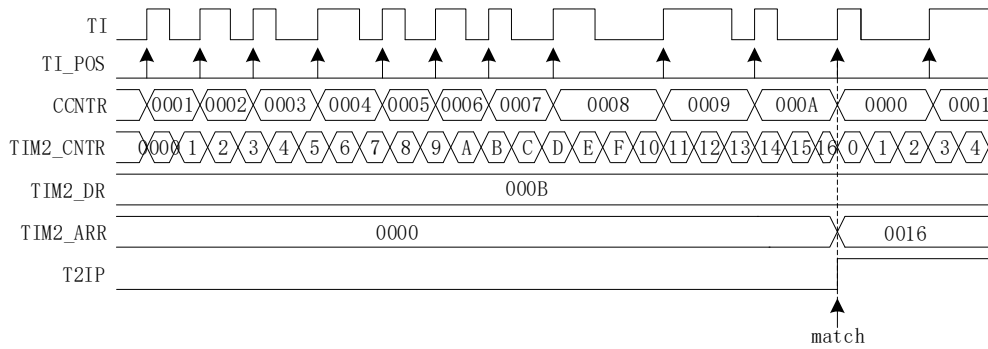

Figure 14-8 Timing Diagram of Input Counter Mode

The Basic Timer is enabled when TIM2\_CR1[T2CEN] is set to 1. If the first active edge of the input signal is detected, TIM2\_CNTR is cleared to 0 and restarts counting. Whenever active edge of the input signal arrives, one is added to the count value of the special counter CCNTR. When the count value reaches TIM2\_DR, TIM2\_CNTR is stored in TIM2\_ARR. Meanwhile, TIM2\_CR1[T2IP] is set to 1, TIM2\_CNTR and CCNTR are cleared to 0 and restart counting.

When the number of input PWM does not reached the set value and TIM2\_CNTR reaches 0xFFFF, an overflow event generates, and the interrupt flag TIM2\_CR1[T2IF] is set to 1. TIM2\_CNTR is cleared to 0 with CCNTR uncleared. TIM2\_CNTR starts counting from 0, and CCNTR continues counting with the previous value.

**14.1.7 QEP & RSD Mode**

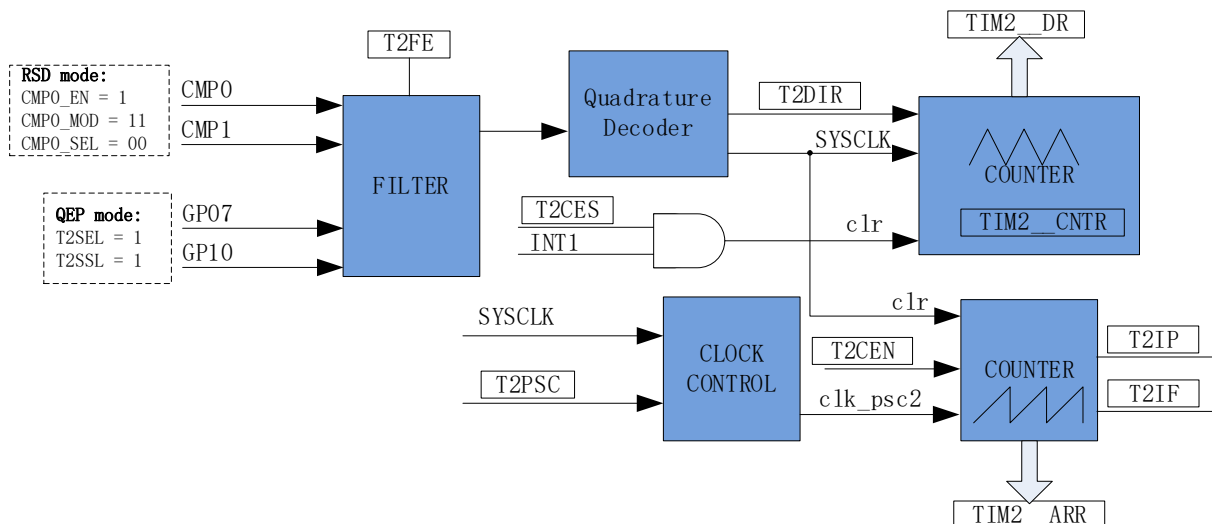

Figure 14-9 Schematic Block Diagram of QEP & RSD Mode

QEP & RSD mode obtains relative position, direction and speed of the motor by detecting orthogonal signals on the two channels. P0.7, P1.0 (QEP mode) or CMP0, CMP1 (RSD mode) are the input signal sources, which are sent to the quadrature decoding module from the filtering module to obtain active edge and direction (TIM2\_CR1[T2DIR]).

Direction change will generate TIM2\_CR1[T2IR] interrupt flag.

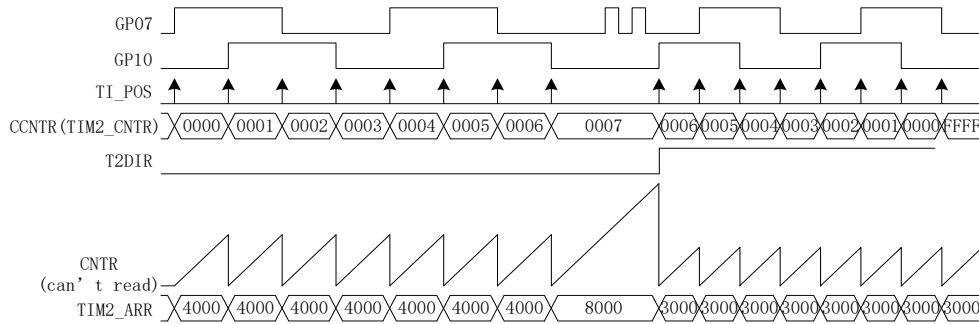

Figure 14-10 Timing Diagram of QEP & RSD Mode

The special counter is an up/down counter, and the signal source is the active edge from orthogonal decoding module. If TIM2\_CR1[T2DIR]=0, the direction is positive, and the special counter counts upward. When the active edge arrives, the counter increases by one. If TIM2\_CR1[T2DIR]=1, the direction is reverse and the special timer counts downward. When the active edge arrives, the counter decreases by one. The special counter can be cleared to 0 by INT1. INT1 is enabled after mechanical zero point of the encoder is connected to any port of INT1. When TIM2\_CR0[T2CES] is set to 1 and INT1 is generated, current count value of the special counter is stored in TIM2\_DR and cleared to 0. If count value of the special counter reaches 65535 from 0, it is automatically cleared to 0. If it decreases from 65535 to 0, it is automatically set to 65535. TIM2\_CNTR is read to obtain the value of special counter.

The Basic Timer is an up-counter used to record the time of two active counting edges. The clock source frequency can be divided. When counting edge arrives, the value of Basic Timer is stored in TIM2\_ARR and cleared to 0, and TIM2\_CR1[T2IP] interrupt flag bit is set to 1. When Basic Timer counts to 0xFFFF, the count overflows and TIM2\_CR1[T2IF] interrupt flag is generated.

**14.1.7.1 RSD Comparator Sampling**

Figure 14-11 PWM ON Sampling mode

During RSD sampling, in order to obtain the accurate BEMF comparison signal, it is necessary to set the ON-delayed sampling time and Off-lead sampling time.

For details, see section 27.1.4.

**14.1.8 Step Mode**

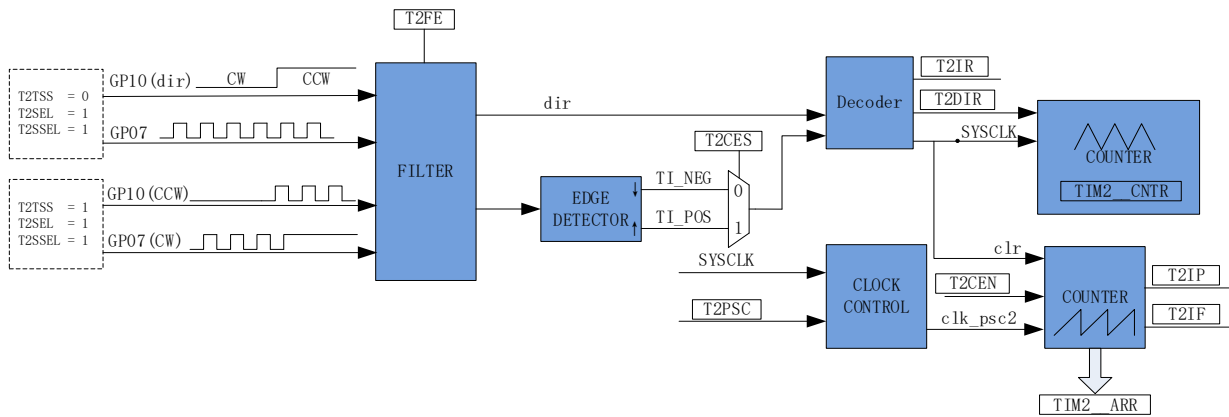

Figure 14-12 Schematic Block Diagram of Step Mode

In Step Mode, relative position, direction and speed of the step motor are obtained by detecting inputs of the two channels. P1.0 is direction input, and P0.7 is pulse input. Setting TIM2\_CR0[T2CES] to select the rising edge or falling edge as the active edge. The input signals are sent to decoding module from the filtering module to obtain the active edge and direction TIM2\_CR1[T2DIR]. The change of direction will generate TIM2\_CR1[T2IR] interrupt.

Note: TIM2\_CR1[T2DIR] and TIM2\_CR1[T2IR] will not change unless P1.0 changes and P0.7 active edge arrives. To generate an interrupt immediately after P1.0 changes, use INT1.

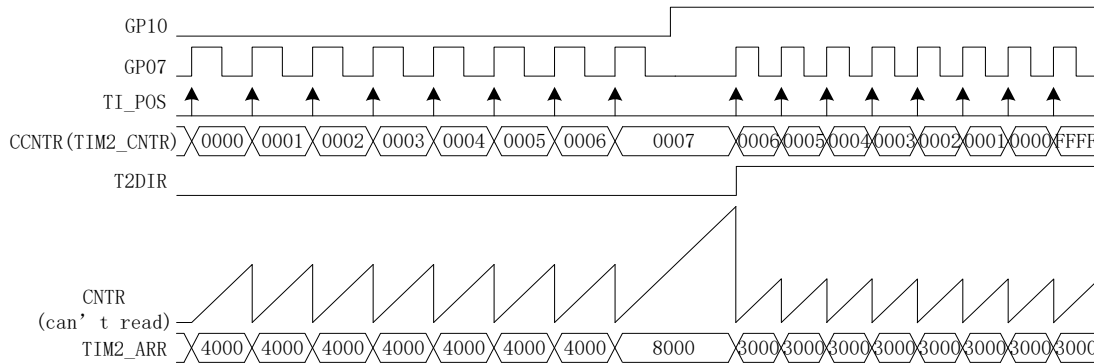

Figure 14-13 Timing Diagram of Step Mode

The special counter is an up/down counter, and the signal source is active edge from the decoding module. When P1.0 = 0, TIM2\_CR1[T2DIR] = 0, the direction is forward. If active edge of P0.7 arrives, the special counter CCNTR increases by 1. When P1.0 = 1, TIM2\_CR1[T2DIR] = 1 and the direction is reverse. If active edge of P0.7 arrives, CCNTR decreases by 1. If count value of the special counter reaches 65535 from 0, it is automatically cleared to 0. If it decreases from 65535 to 0, it is automatically set to 65535. TIM2\_CNTR is read to obtain the value of special counter.

The Basic Timer is an up counter, which uses the output of prescaler as the clock source to record the time between two active counting edges. When active counting edge arrives, the value of Basic Timer is stored in TIM2\_ARR and

cleared to 0, and TIM2\_CR1[T2IP] interrupt flag bit is set to 1. When Basic Timer counts to 0xFFFF, the count overflows and the interrupt (TIM2\_CR1[T2IF]) is generated.

## 14.2 Timer2 Registers

### 14.2.1 TIM2\_CR0 (0xA1)

Bit	7	6	5	4	3	2	1	0

## 15 Timer3/Timer4

### 15.1 Timer3/Timer4 Instructions

Timer3/Timer4 support output and input modes:

- Output mode: Generate PWM
- Input capture mode: Detect the duration of high and low level of input PWM, which can be used to calculate PWM duty cycle

Timer3/Timer4 Features:

- 3-bit programmable prescaler divides system clock as the clock source for Basic Timer (clock source of Timer3 can be doubled to 48MHz in input capture mode)
- 16-bit up counting Basic Timer; the output of the prescaler serves as the counting clock source
- Input signal filtering
- Input signal edge detection
- Output PWM signal, single compare output
- Interrupt event

#### 15.1.1 Prescaler

Frequency prescaler is used to divide the system clock and generate clock source for Basic Timer. 8 frequency division coefficients of prescaler are available and can be selected by TIMx\_CR0[TxPSC]. Since this register has no buffer, the clock source frequency is updated immediately after TIMx\_CR0[TxPSC] is written. Therefore, the frequency division coefficients shall be configured when Basic Timer is not working. The clock source frequency formula is:  $clk\_psc2 = SYSCLK / (2^{TIM3\_CR0[TxPSC]})$ . The clock rate corresponding to different TIM2\_CR0[TxPSC] value as shown in Table 15-1.

Table 15-1 Mapping between Clock rate and TxPSC

TIMx_CR0[TxPSC]	Coefficient	clk_pscx (Hz)	TIMx_CR0[TxPSC]	Coefficient	clk_pscx (Hz)
000	1	24M	100	16	1.5M
001	2	12M	101	32	750K
010	4	6M	110	64	375K
011	8	3M	111	128	187.5K

#### 15.1.2 Reading, Writing and Counting of TIMx\_CNTR

When TIMx\_CR1[TxEN] = 1, TIMx\_CNTR starts count. The write operation to TIMx\_CNTR directly changes the value of the register, so the counter shall be disabled before the write operation. When reading TIMx\_CNTR, the software reads the high-order byte first and then the low-order byte, and the hardware caches the low-order byte simultaneously. When reading low-order byte, the software reads the cached data.

### 15.1.3 Output Mode

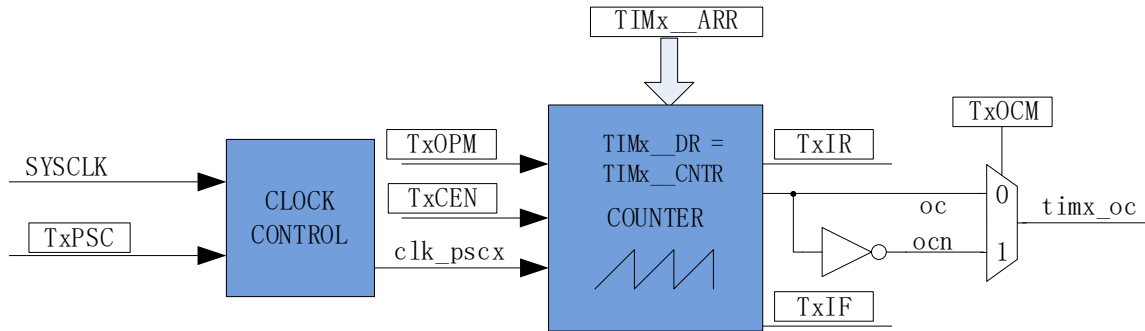

Figure 15-1 Schematic Block Diagram of Output Mode

The output mode generates output signals according to  $TIMx\_CR0[TxOCM]$ , and the comparison results between  $TIMx\_CNTR$  and registers  $TIMx\_DR$ ,  $TIMx\_ARR$ . Meanwhile, corresponding interrupts are generated.

#### 15.1.3.1 High/Low Level Output

When  $TIMx\_CR0[TxOCM] = 0$  and  $TIMx\_DR > TIMx\_ARR$ , the output signal is always low. When  $TIMx\_CR0[TxOCM] = 1$  and  $TIMx\_DR > TIMx\_ARR$ , the output signal is always high..

#### 15.1.3.2 PWM Generation

In PWM generation mode,  $TIMx\_ARR$  determines PWM cycle,  $TIMx\_DR$  determines the duty cycle, and duty cycle =  $TIMx\_DR / TIMx\_ARR * 100\%$ . If  $TIMx\_CR0[Tx\_OCM] = 0$ , the low level is output when  $TIMx\_CNTR < TIMx\_DR$ , and the high level is output when  $TIMx\_CNTR \geq TIMx\_DR$ . If  $TIMx\_CR0[Tx\_OCM] = 1$ , the high level is output when  $TIMx\_CNTR < TIMx\_DR$ , and the low level is output when  $TIMx\_CNTR \geq TIMx\_DR$ . When  $TIMx\_CNTR > TIMx\_ARR$ , the output signal is reversed.

#### 15.1.3.3 Interrupt Event

- When  $TIMx\_CNTR = TIMx\_DR$ , a compare match interrupt is generated. The interrupt flag  $TIMx\_CR1[TxIR]$  is set to 1, and the timer continues.
- When  $TIMx\_CNTR = TIMx\_ARR$ , an overflow event is generated. The interrupt flag  $TIMx\_CR1[TxIF]$  is set to 1, and the timer is cleared to 0.  $TIMx\_CR0[TxOPM]$  determines whether the timer recounts. The timer stops when  $TIMx\_CR0[TxOPM] = 1$ , and restarts when  $TIMx\_CR0[TxOPM] = 0$ .

Figure 15-2 Output Waveform of Output Mode

### 15.1.4 Input Signal Filtering and Edge Detection

Figure 15-3 Block Diagram of Input Signal Filtering and Edge Detection

The input signals of Timer3/Timer4 come from GPIO. TIMx\_CR1[TINM] is configured to disable the filtering circuit or filter out the input noise below 4/8/16 system clock cycles. The filtered signal is 4/8/16 system clock cycles delayed than the signal before filtering.

Figure 15-4 Timing Diagram of Filter Module

The edge detection module detects the filtered input signal from filtering module, and records the rising edge and falling edge for input capture mode.

**15.1.5 Input Capture Mode**

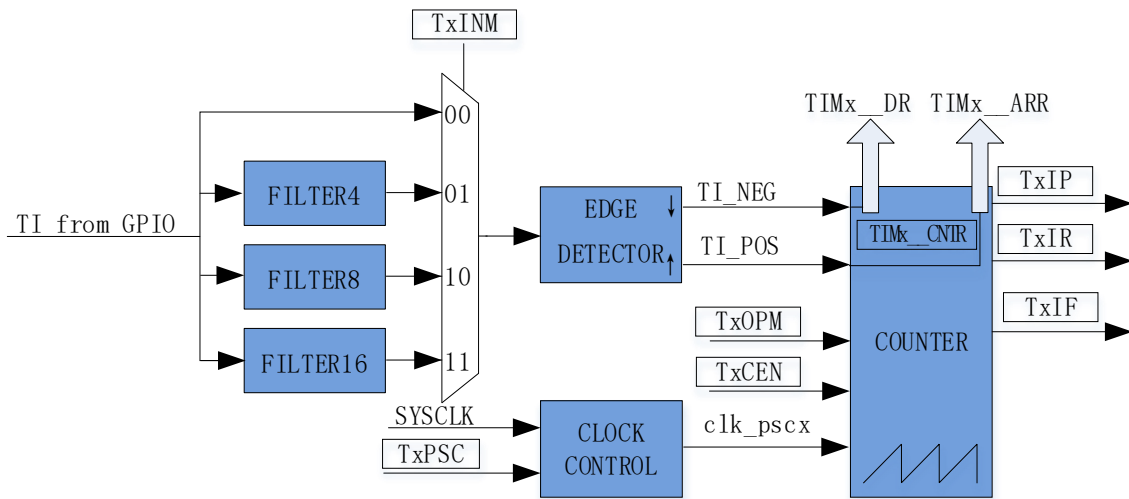

Figure 15-5 Schematic Block Diagram of Input Capture Mode

The input capture mode detects pulse width and period of the input PWM signals. When  $TIMx\_CR0[TxOCM] = 0$ , the time between two adjacent rising edges forms one cycle, and the time from rising edge to falling edge forms the pulse width (HIGH). When  $TIMx\_CR0[TxOCM] = 1$ , the time between two adjacent falling edges forms one cycle, and the time from falling edge to rising edge forms the pulse width (LOW). The pulse width and the period obtained by  $TIMx\_CNTR$  are stored in  $TIMx\_DR$  and  $TIMx\_ARR$  respectively.

Figure 15-6 Timing Diagram of Input Capture Mode ( $TIMx\_CR0[TxOCM] = 0$ )

For example, when  $TIMx\_CR0[TxOCM] = 0$ ,  $TIMx\_CR1[TxEN]$  is set to “1” to enable the timer. When the first rising edge is detected, the counter is cleared to “0” and restarts counting. When the falling edge is detected, the value of  $TIMx\_CNTR$  is stored in  $TIMx\_DR$ . Meanwhile, the interrupt flag bit  $TIMx\_CR1[TxIR]$  is set to “1”, and  $TIMx\_CNTR$  continues to count. When the second rising edge is detected, the value of  $TIMx\_CNTR$  is saved into  $TIMx\_ARR$ . The interrupt flag bit  $TIMx\_CR1[TxIP]$  is set to “1” and  $TIMx\_CNTR$  is cleared to “0”.  $TIMx\_CR0[TxOPM]$  determines whether the counter restarts. If  $TIMx\_CR0[TxOPM] = 1$ , the timer stops; and if

TIMx\_CR0[TxOPM] = 0, it restarts.

An overflow event occurs if Timer3/4 do not detect the second rising edge of the input and the count value TIMx\_CNTR reaches 0xFFFF. In this case, interrupt flag bit TIMx\_CR1[TxIF] is set to “1”, and TIMx\_CNTR is cleared to “0”. TIMx\_CR0[TxOPM] determines whether the counter restarts. If TIMx\_CR0[TxOPM] = 1, the counter stops; and if TIMx\_CR0[TxOPM] = 0, the counter restarts.

### 15.1.6 FG Output Mode of Timer4

See FG Generation.

## 15.2 Timer3/Timer4 Registers

## 16 Systick

### 16.1 Systick Instructions

The chip can generate Systick interrupts with a fixed frequency, and the interrupt cycle is controlled by SYST\_ARR. Systick interrupt is enabled when DRV\_SR[SYSTIE] is set to 1, and the interrupts are accessed by P10.

### 16.2 Systick Registers

#### 16.2.1 DRV\_SR (0x4061)

Bit	7	6	5	4	3	2	1	0
Name	SYSTIF	SYSTIE	FGIF	DCIF	FGIE	DCIP	DCIM	
Type	R/W0	R/W	R/W0	R/W0	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	SYSTIF	Systick Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to 0 1: No effect						
[6]	SYSTIE	Systick Interrupt Enable 0: Disable 1: Enable						
[5]	FGIF	FG Interrupt Flag When FOC Drive/Square Wave Drive is enabled, an FGIF interrupt is generated in each rotation cycle (electrical cycle) Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to 0 1: No effect						
[4]	DCIF	Driver Compare Match Interrupt Flag When the Driver counter value is equal to DRV_COMR, the system decides whether to generate an interrupt according to the counting direction set by DRV_SR[DCIM] Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to 0 1: No effect						
[3]	FGIE	FG Interrupt Enable After the interrupt is enabled, one FG interrupt is generated in each electric cycle during FOC drive/square wave control 0: Disable 1: Enable						
[2]	DCIP	Number of PWM Cycles Generating Compare Match Interrupt 0: 1 interrupt in 1 PWM cycle 1: 1 interrupt in 2 PWM cycles						
[1:0]	DCIM	Compare Match Interrupt Mode Selection When the count value is equal to DRV_COMR, whether to generate an interrupt request is determined by DRV_SR[DCIM]. 00: No interrupt is generated.						

		01: Interrupt is generated when the counter counts up. 10: Interrupt is generated when the counter counts down. 11: Interrupt is generated when the counter counts up/down.
--	--	---

**16.2.2 SYST\_ARR (0x4064, 0x4065)**

SYST_ARRH(0x4064)								
Bit	15	14	13	12	11	10	9	8
Name	SYST_ARR[15:8]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	0	1	1	1	0	1
SYST_ARRL(0x4065)								
Bit	7	6	5	4	3	2	1	0
Name	SYST_ARR[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	1	1	1	1	1	1
Bit	Name	Description						
[15:0]	SYST_ARR	Systick Reload Value This value determines the cycle at which systick interrupts are generated. The default time is 1ms. Calculation formula: systick interrupt frequency = SYSCLK/(SYST_ARR[15:0] + 1) Range [0,65535]						

**17 Driver**

**17.1 Driver Instructions**

**17.1.1 Driver Introduction**

The chip has built-in pre-driver output.

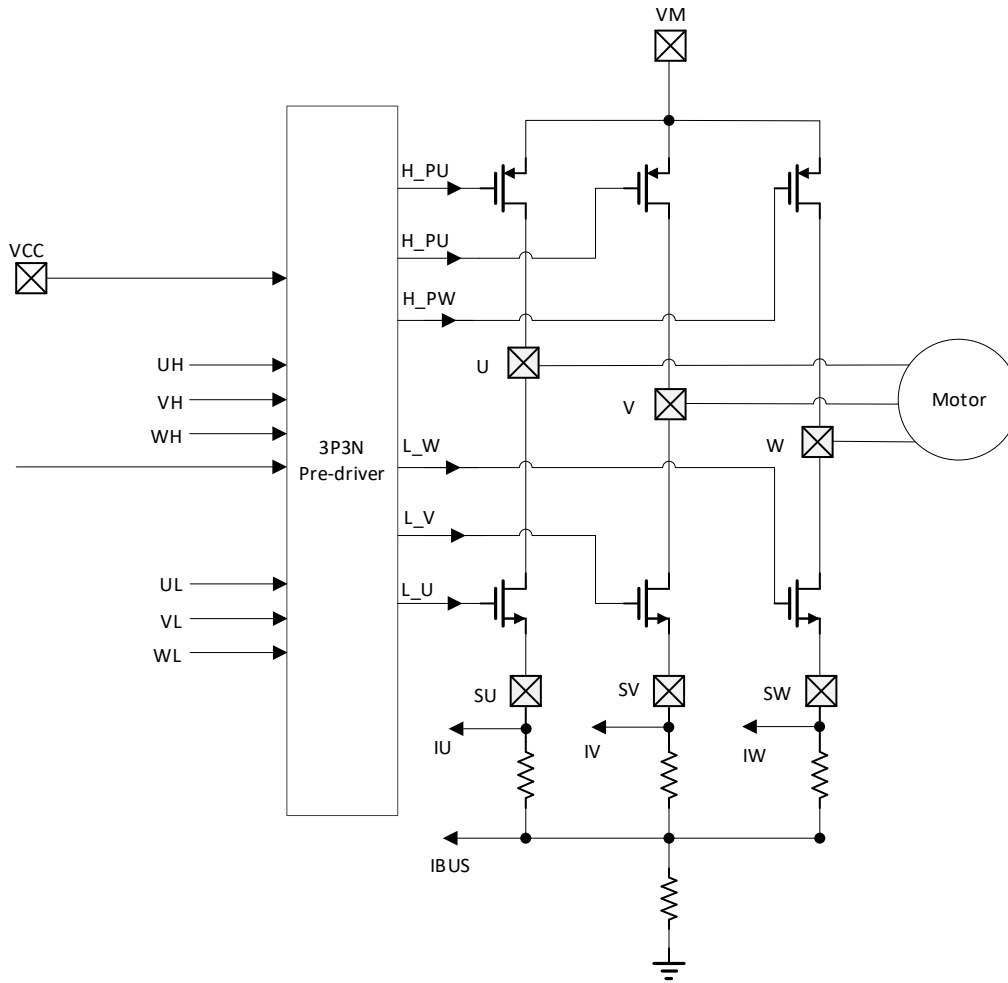

Figure 17-1 Block Diagram of Pre-driver Module

3P3N Pre-driver module is shown in Figure 17-1. UH/VH/WH and UL/VL/WL, 3-phase PWM signal, are the input signals. H\_PU/H\_PV/H\_PW and L\_U/L\_V/L\_W are the output signals. H\_PU/H\_PV/H\_PW are reversely related to UH/VH/WH, and DRV\_CR[DRVOE] is the enable bit.

Pre-driver module is enabled when DRV\_CR[DRVOE] is set to 1. UH/VH/WH are reversely and sent to H\_PU/H\_PV/H\_PW for driving gate of PMOS. UL/VL/WL are sent to L\_U/L\_V/L\_W for driving gate of NMOS. PMOS and NMOS output voltages to drive motors.

## 17.1.2 Output Control Module

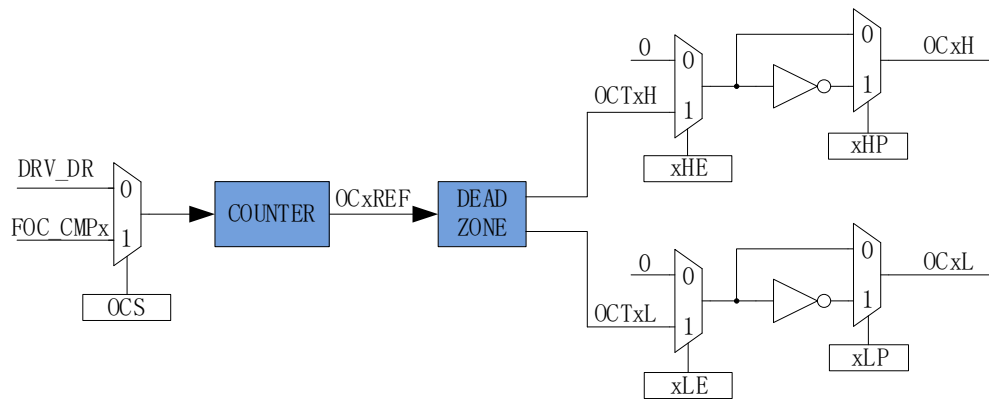

Figure 17-2 Block Diagram of Output Control Module Pre-stage

Before Driver module works, DRV\_CR[MESEL] is set to “1” to select FOC mode or to “0” to select square-wave control mode.

If DRV\_CR[OCS]=0, comparison value of PWM comes from DRV\_DR, and reference source of the output PWM signal is OCTxH. When OCxH and OCxL are output at the same time, OCTxL outputs reverse signal. If DRV\_CR[OCS] = 1, comparison value of PWM comes from FOC module, and reference source of the output PWM signal is OCTxL. When OCxH and OCxL are output at the same time, OCTxH outputs reverse signal.

### 17.1.2.1 Count and Compare Module

DRV\_CR[OCS] is configured to select the comparison value of PWM from FOC\_CMPU/V/W of FOC module or DRV\_DR set by software. The comparison value is sent to the counter for comparison to obtain the 3-phase original PWM signal OCxREF, and DRV\_DR is used for motor pre-charging, braking and square-wave control. If DRV\_CNTR is smaller than the comparison value, OCxREF outputs high-level signal, and if DRV\_CNTR is larger than DRV\_DR, OCxREF outputs low-level signal.

When DRV\_CR[OCS] = 1, FOC\_CMPU/V/W is compared with the count value to generate the duty cycle OC1REF/OC2REF/OC3REF.

When DRV\_CR[OCS] = 0, DRV\_DR set by software is compared with the count value to generate OC1REF/OC2REF/OC3REF with the same duty cycle. Duty cycle = DRV\_DR/DRV\_ARR\*100%.

Figure 17-3 PWM Generation Diagram

**17.1.2.2 Deadtime Module**

OCxREF has hardware deadtime insertion. Each channel has an 8-bit deadtime generator, and three channels have the same dead time, which is set by DRV\_DTR. In the rising edge of OCxREF, the delay time for OCxL to generate high-level output is the one set by DRV\_DTR. In the falling edge of OCxREF, the delay time for OCxH to generate high-level output is the one set by DRV\_DTR.

Figure 17-4 Complementary Output with Deadtime Insertion

**17.1.2.3 Enable and Polarity of Output Signals**

DRV\_CMR[xHE] and [xLE] are configured to select the output mode as idle-level output or complementary output with deadtime inserted. DRV\_CMR[xHP] and [xLP] are configured to select the polarity of output. In the application of square wave control, Timer1 automatically controls DRV\_CMR to implement phase commutation feature. When DRV\_CR[MESEL] is set to 0, square-wave control mode is enabled. After Timer1 generates a writing sequence event, the data stored in the corresponding TIM1\_DBRx is transferred to DRV\_CMR.

Figure 17-5 Timer1 Automatically Controls DRV\_CMx and CMP\_CR2[4:3]

DRV\_DR, DRV\_ARR and DRV\_CMx can be configured to implement pre-charging, brake, etc. DRV\_DR and DRV\_ARR control the duty cycle and frequency of PWM. DRV\_CMx[xHE] and DRV\_CMx[xLE] control the output modes.

Figure 17-6 Waveform Diagram of Pre-charging

Figure 17-7 Waveform Diagram of Brake

**17.1.2.4 MOE**

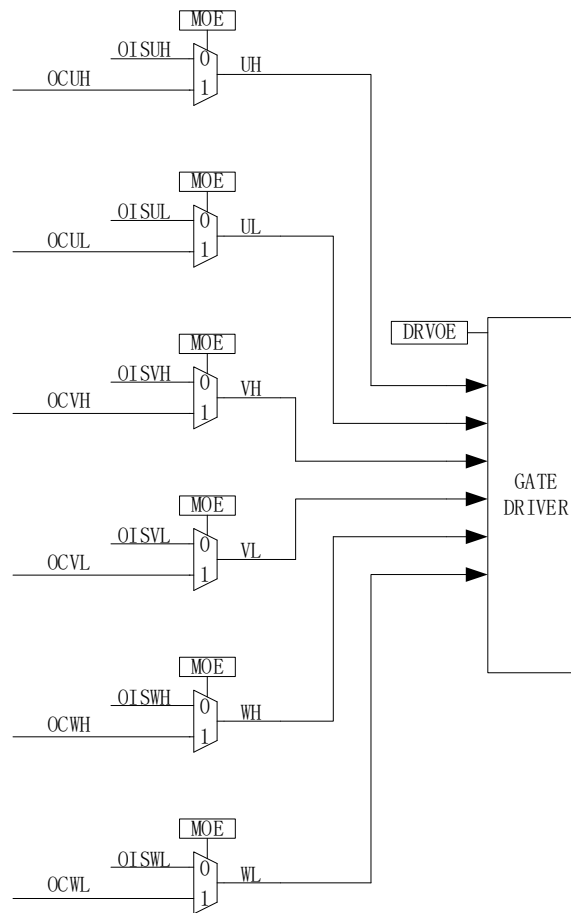

Figure 17-8 Block Diagram of Rear Stage of Output Control Module

When DRV\_OUT[MOE] is enabled, PWM waveform is generated for motor driving. When DRV\_OUT[MOE] is disabled, the idle level set by software is output to stop motor driving.

**17.1.2.5 Interrupt**

**17.1.2.5.1 Compare Match Interrupt**

The generation conditions and time for compare match interrupt are configured by DRV\_SR[DCIM] and DRV\_COMR respectively. When the counter reaches to the value set in DRV\_COMR and the conditions set by DRV\_SR[DCIM] are met, a compare match interrupt is generated and the interrupt flag DRV\_SR[DCIF] is set to 1 by hardware.

Figure 17-9 Compare Match Interrupt of Driver

### 17.1.2.5.2 FG Interrupt

FG interrupt is enabled when DRV\_SR[FGIE] is set to “1”. The motor generates an interrupt for every electrical cycle.

## 17.2 Driver Registers

### 17.2.1 DRV\_CR (0x4062)

Bit	7	6	5	4	3	2	1	0
Name	DRVEN	DDIR	FOCEN	DRPE	OCS	MESEL	RSV	DRVOE
Type	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W
Reset	0	0	0	0	0	0	—	0
Bit	Name	Description						
[7]	DRVEN	Counter Enable 0: Disable 1: Enable						
[6]	DDIR	Output Direction (Forward or Reverse) This bit is valid for both square-wave control and FOC. In sensorless FOC mode, setting this bit changes motor rotation. In Hall-sensored FOC mode, it is also required to modify the angle by the software. In square-wave control mode, parameters related to Timer1 shall be configured. 0: Forward 1: Reverse						
[5]	FOCEN	FOC Module Enable 0: Disable 1: Enable						
[4]	DRPE	DRV_DR Preload Enable When preload is enabled, the data written to DRV_DR is updated after a timer underflow event occurs. When preload is disabled, the data written to DRV_DR is updated immediately. 0: Disable 1: Enable						
[3]	OCS	Comparison Source Selection 0: DRV_DR 1: FOC module						
[2]	MESEL	ME Operating Mode Selection 0: Square wave control mode 1: FOC mode						
[1]	RSV	Reserved						

[0]	DRVOE	Driver Enable 0: Disable 1: Enable
-----	-------	--

**17.2.2 DRV\_SR (0x4061)**

Bit	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[7]	SYSTIF	Systick Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[6]	SYSTIE	Systick Interrupt Enable 0: Disable 1: Enable
[5]	FGIF	FG Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[4]	DCIF	Driver Compare Match Interrupt Flag When the driver counter value is equal to DRV_COMR, the system decides whether to generate an interrupt according to DRV_SR[DCIM] Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0” 1: No effect
[3]	FGIE	FG Interrupt Enable After interrupt feature is enabled, one FG interrupt is generated in each electric cycle under FOC/square-wave control mode. 0: Disable 1: Enable
[2]	DCIP	Number of PWM Cycles Generating Compare Match Interrupt 0: 1 PWM cycle 1: 2 PWM cycles
[1:0]	DCIM	Compare Match Interrupt Mode Selection When the count value is equal to DRV_COMR, the system decides whether to generate an interrupt request according to DRV_SR[DCIM]. 00: No interrupt is generated. 01: Interrupt is generated when the counter counts up. 10: Interrupt is generated when the counter counts down. 11: Interrupt is generated when the counter counts up/down.

**17.2.3 DRV\_OUT (0xF8)**

Bit	7	6	5	4	3	2	1	0
Name	MOE	RSV	OISWL	OISWH	OISVL	OISVH	OISUL	OISUH
Type	R/W	—	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	—	0	0	0	0	0	0

Bit	Name	Description
[7]	MOE	<p>Main Output Enable</p> <p>This bit is used to select the source for high and low sides of the bridge of 3-phase output signals. It can be set to 1 and cleared to 0 by software. When bus current protection is generated (refer to 27.1.1.1, this bit is automatically cleared to 0 by the hardware to turn off the output.</p> <p>0: Disable. The output is from the idle levels set by DRV_OUT[OISUH/OISVH/OISWH] and DRV_OUT[OISUL/OISVL/OISWL]</p> <p>1: Enable. The output is from the comparison value of the timer</p>
[6]	RSV	Reserved
[5]	OISWL	Output Idle Level of WL See descriptions on DRV_OUT[OISUH].
[4]	OISWH	Output Idle Level of WH See descriptions on DRV_OUT[OISUH].
[3]	OISVL	Output Idle Level of VL See descriptions on DRV_OUT[OISUH].
[2]	OISVH	Output Idle Level of VH See descriptions on DRV_OUT[OISUH].
[1]	OISUL	Output Idle Level of UL See descriptions on DRV_OUT[OISUH].
[0]	OISUH	<p>Output Idle Level of UH</p> <p>This bit sets the output idle level of UH. When DRV_OUT[MOE] = 0, it outputs idle level and disables MOS.</p> <p>0: Low level</p> <p>1: High level</p>

**17.2.4 DRV\_CMRR (0x405C, 0x405D)**

DRV_CMRR(0x405C)								
Bit	15	14	13	12	11	10	9	8
Name	RSV				WHP	WLP	VHP	VLP
Type	—	—	—	—	R/W	R/W	R/W	R/W
Reset	—	—	—	—	0	0	0	0

DRV_CMRL(0x405D)								
Bit	7	6	5	4	3	2	1	0
Name	UHP	ULP	WHE	WLE	VHE	VLE	UHE	ULE
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	Name	Description
[15:12]	RSV	Reserved
[11]	WHP	<p>Output Polarity of WH</p> <p>0: Active High</p> <p>1: Active Low</p>
[10]	WLP	<p>Output Polarity of WL</p> <p>0: Active High</p> <p>1: Active Low</p>
[9]	VHP	<p>Output Polarity of VH</p> <p>0: Active High</p> <p>1: Active Low</p>

[8]	VLP	Output Polarity of VL 0: Active High 1: Active Low
[7]	UHP	Output Polarity of UH 0: Active High 1: Active Low
[6]	ULP	Output Polarity of UL 0: Active High 1: Active Low
[5]	WHE	Output Enable of WH 0: Disable 1: Enable
[4]	WLE	Output Enable of WL 0: Disable 1: Enable
[3]	VHE	Output Enable of VH 0: Disable 1: Enable
[2]	VLE	Output Enable of VL 0: Disable 1: Enable
[1]	UHE	Output Enable of UH 0: Disable 1: Enable
[0]	ULE	Output Enable of UL 0: Disable 1: Enable

Notes:

- When DRV\_CM[R/W/V/ULE] and DRV\_CM[R/W/V/UHE] are 1 at the same time, high-side and low-side outputs of W/V/U-phases are complementary to PWM signals with deadtime insertion. Low side output is the reference polarity
- In square-wave control mode, Timer1 automatically controls DRV\_CM[R] register.

### 17.2.5 DRV\_ARR (0x405E, 0x405F)

DRV_ARRH(0x405E)								
Bit	15	14	13	12	11	10	9	8
Name	RSV		DRV_ARR [13:8]					
Type	—	—	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	—	0	0	0	0	0	0

[15:12]	RSV	Reserved						
[11:0]	DRV__CNTR	Counter Value The clock rate for the calculation of the DRV__CNTR is 12MHz $Duty\ cycle\ of\ driver = DRV\_CNTR * 4 / DRV\_ARR * 100\%$  Note: DRV__CNTR can only be written when DRV_CR[DRVEN] = 1 Range: [0,4095]						

## 18 WDT

The watchdog timer (WDT) is a timer that works on the internal slow clock to monitor the master program operation and prevent the MCU running out. Watchdog works as follows: After watchdog operates, WDT starts counting. When WDT overflows, watchdog sends a signal to reset the MCU and the program restarts running from address 0. During the operation of master program, WDT has to be initialized at regular intervals to prevent WDT overflowing.

After being enabled, WDT starts counting from 0. When it reaches 0xFFFFC, watchdog outputs a signal that is 4 internal slow clock cycles wide to reset the MCU, and the program starts running from address 0. WDT has to be initialized at regular intervals during operation, and the WDT rolls over to WDT\_ARR setting and restarts counting.

### 18.1 WDT Notes

- When MCU enters standby or sleep mode, WDT stops counting, but the count values are retained.
- WDT is automatically disabled during emulation.
- RST\_SR[RSTWDT] is set to 1 when MCU is reset by WDT counter overflow.

### 18.2 WDT Operations

1. Set CCFG1[WDT\_EN] = 1 to start the WDT which then starts counting from 0;
2. Set WDT\_ARR (this operation can also be performed before starting WDT);
3. Set WDT\_CR[WDTRF] = 1 in the running of program. The WDT rolls over to WDT\_ARR setting.

### 18.3 WDT Registers

#### 18.3.1 WDT\_CR (0x4026)

Bit	7	6	5	4	3	2	1	0
Name	RSV							WDTRF

[5]	RSV	Reserved
[4]	ISOSCEN	Internal Slow Clock Enable 0: Disable 1: Enable
[3:0]	RSV	Reserved

## 19.4 Clock Calibration

### 19.4.1 Introduction

Clock calibration is a feature that uses the internal slow clock to calibrate the internal fast clock. Calibration principle: A 12-bit counter is used to count the length of 4 slow clock cycles with the fast clock as the clock source. Calibration operations: Set CAL\_CR0[**CAL\_STA**] = 1 to start the calibration. Read CAL\_CR0[**CAL\_BUSY**] in software to check whether the calibration is finished. When the calibration is completed (CAL\_CR0[**CAL\_BUSY**] = 0), the readout of CAL\_CR0[**CAL\_ARR**] is the value of the length of counting 4 slow clock cycles.

### 19.4.2 Clock Calibration Registers

#### 19.4.2.1 CAL\_CR0 (0x4044) CAL\_CR1 (0x4045)

CAL_CR0(0x4044)								
Bit	15	14	13	12	11	10	9	8
Name	CAL_STA/ CAL_BUSY	RSV			CAL_ARR[11:8]			
Type	R/W1	—	—	—	R/W	R/W	R/W	R/W
Reset	1	—	—	—	0	0	0	0
CAL_CR1(0x4045)								
Bit	7	6	5	4	3	2	1	0
Name	CAL_ARR[7:0]							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[15]	CAL_STA /CAL_BUSY	Clock Calibration Enable Read: 0: Calibration is completed. 1: Calibration is in progress. Write: 0: No effect. 1: Clock calibration starts.						
[14:12]	RSV	Reserved						
[11:0]	CAL_ARR	Calibrate Count Values The value of fast clock to count 4 slow clock cycles  Note: When this value is 0, it indicates that there is no corresponding slow clock input; and when this value is 0xFFFF, it indicates a count overflows (slow clock is too slow or fast clock is too fast)						

## 20 IO

### 20.1 IO Introduction

The chip has up to 25 GPIO pins: P0.0 ~ P0.1, P0.6 ~ P0.7, P1.0 ~ P1.7, P2.0 ~ P2.4, P2.6 ~ P2.7, P3.0 ~ P3.2, P3.4 ~ P3.5 and P3.7.

### 20.2 IO Instructions

Each GPIO port pin has relevant configuration registers to meet different application requirements. For example, P0.0 is mapped to register P0, and P1.0 to register P1. P0\_OE and P1\_OE registers are configured for digital input and output.

- The enable bits of pull-up resistors and pull-down resistors are configured to “1”. See 20.3.8 P0\_PU (0x4053) ~ 20.3.11 P3\_PU (0x4056) for port pins and registers.
- See section 5.3 GPIO Electrical Characteristics for the values of pull-up resistors and pull-down resistors.
- The relevant bits of registers P1\_AN, P2\_AN and P3\_AN are configured to “1”. See 20.3.5 P1\_AN (0x4050) ~ 20.3.7 P3\_AN (0x4052) for port pins and registers. After the port pins are configured to analog mode, all their digital features are disabled and the port state is 0 by reading relevant bits in P1 register.
- Pull-up resistors of P1.6 ~ P1.7, P2.0 ~ P2.7 and P3.0 ~ P3.5 are automatically disabled when the port pins are configured as analog signal input pins.

## 20.3 IO Registers

### 20.3.1 P0\_OE (0xFC)

Bit	7	6	5	4	3	2	1	0	
Name	P0_OE

CPL	Bitwise logical converse operation
INC, DEC	+1, -1 logical operation
DJNZ	Jump if the bit is not “0”
MOV Px,y,C	Assign carry bit C to Px,y
CLR Px,y	Px,y is cleared to “0”
SETB Px,y	Px,y is set to “1”

**21 ADC**

**21.1 ADC Introduction**

The ADC module is a 12-bit successive approximation register ADC with 13 channels, where channel 0 ~ 2, 4 ~ 5 and 7 ~ 13 are external pin channels and channel 14 is internal channel. VCC pin is divided by built-in resistor, and the result is sampled by channel 14. The ratio of voltage division is configured by ADC\_CR[URATIO]. The sampling mode supports sequential sampling (i.e., from ADC channel 0 to ADC channel 14 in sequence) and triggered sampling (including FOC triggered sampling mode and Timer1 triggered sampling mode). The result of sequential sampling is stored in ADCx\_DR (x = 0 ~ 14) in right-aligned or left-second-highest-bit-aligned format. The result of triggered sampling is sent to FOC module or Timer1 module instead of ADCx\_DR for motor drive. The relevant registers of FOC module or Timer1 module are always left-second-highest-bit-aligned to store the triggered sample results. Triggered sampling is done automatically by hardware and sequential sampling is controlled by software. The priority of triggered sampling is higher than that of sequential sampling. If both triggered sampling and sequential sampling are applied at the same time, triggered sampling is performed first, and ADC automatically restores sequential sampling mode upon completion of triggered sampling.

The clock source of ADC is 12MHz, and the sampling time is set by DAC\_CR[5:2] and ADC\_SCYC. See ADC Electrical Characteristics for the sampling time range and conversion time.

**21.2 ADC Block Diagram**

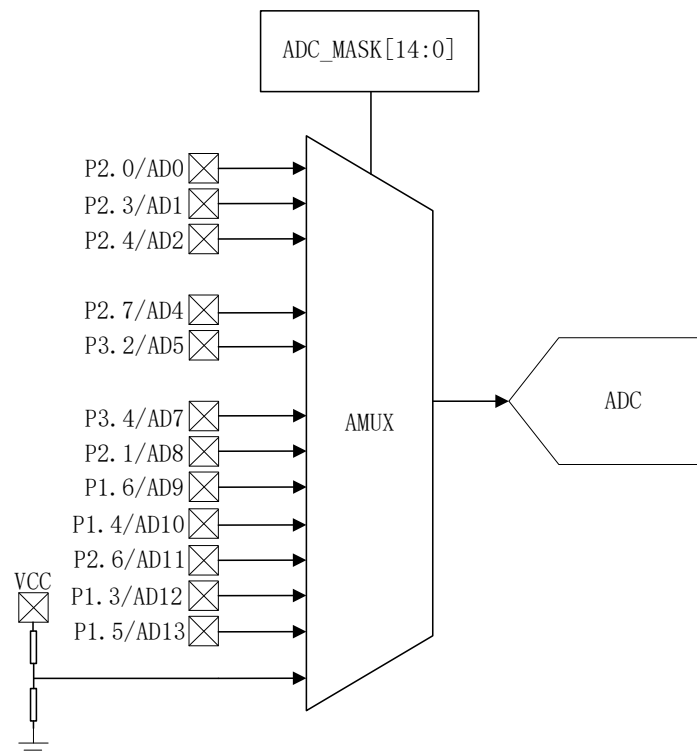

Figure 21-1 ADC Multiplexer Block Diagram

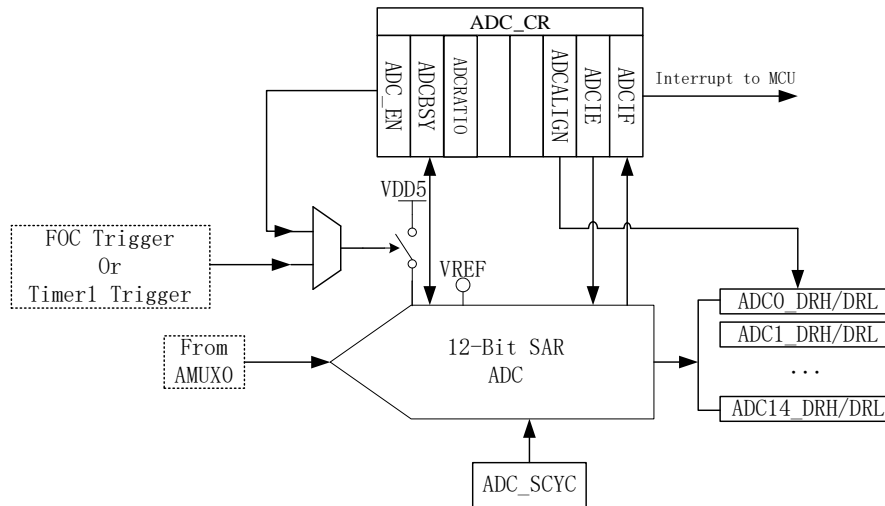

Figure 21-2 ADC Functional Block Diagram

### 21.3 ADC Operations

#### 21.3.1 Sequential Sampling Mode

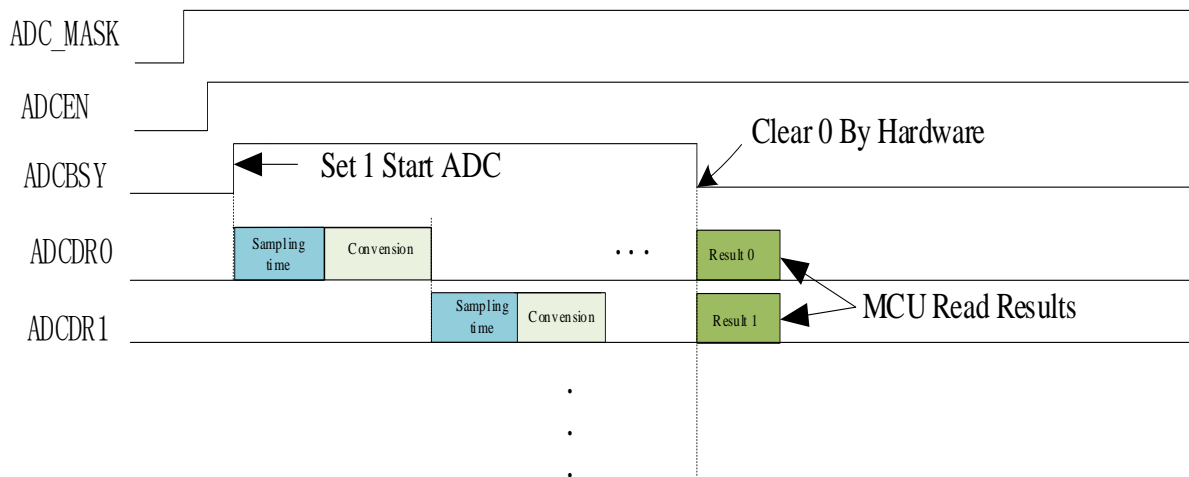

Figure 21-3 Timing Diagram of ADC Sequential Sampling Mode

ADC Operations:

1. Configure VREF\_CR[VREFVSEL] to select appropriate ADC reference voltage (VREF);
2. Configure ADC\_MASK to enable the corresponding channel required to sample;
3. Configure ADC\_SCYC (minimum value is 3) to select the sampling period of each channel;
4. Set ADC\_CR[ADCEN] to 1 to enable ADC;
5. Set ADC\_CR[ADCBSY] to 1 to start ADC;
6. When ADC\_CR[ADCBSY] = 0, ADC results are read by ADCx\_DR.

Note: The ADC conversion sequence is from low to high according to the enabled channel (i.e., when channel 2/3/4

is enabled, the signal is sampled in order of 2/3/4, and then a single conversion result is read after confirming ADC [ ADCBSY ] = 0).

### 21.3.2 Triggered Sampling Mode

When FOC module is enabled, ADC channel 0/1/2/4/14 can be used for FOC triggered sampling. FOC\_CR0[UCSEL] is configured to select ADC channel 2 or channel 14 as voltage sampling channel. In single-shunt current sampling mode, ADC channel 4 is used for itrip sampling. In dual-shunt current sampling mode, ADC channel 0 is used for IA sampling and channel 1 for IB sampling. In triple-shunt current sampling mode, ADC channel 0 is used for IA sampling, channel 1 for IB sampling and channel 4 for IC sampling.

When Timer1 is enabled, ADC channel 4 is used for bus current sampling. TIM1\_CR3[T1TIS] is configured to select the input source of position detection as ADC. When CMP0\_CR4[CMP0FS] = 0, ADC channel 10 is used for U-phase voltage sampling, channel 9 for V-phase voltage sampling and channel 8 for W-phase voltage sampling. When CMP0\_CR4[CMP0FS] = 1, ADC channel 10 is used for U-phase voltage sampling, channel 12 for V-phase voltage sampling and channel 13 for W-phase voltage sampling.

### 21.3.3 Output Data Format

Registers ADCx\_DRH and ADCx\_DRL hold the high-order bits and the low-order bits of ADC sampling results. Data can be right-aligned or left-second-highest-bit-aligned by configuring ADC\_CR[ADCALIGN]. The relation between the input voltage and result data is shown as in Table 21-1. The bits, which are not used in ADCx\_DRH and ADCx\_DRL, are set to 0.

Table 21-1 Relation between the Input Voltage and Result Data

Input Voltage	Right-aligned	Left-second-highest-aligned
0	0x0000	0x0000
VREF/2	0x0800	0x4000
VREF	0x0FFF	0x7FF8

[15:0]	ADC14_DR	ADC channel 14 conversion result upon completion of ADC conversion in the Sequential Sampling Mode Data alignment is selected according to ADC_CR[ADCALIGN] setting  Note: ADC results in triggered sampling mode are not updated to this register.						

**22 DAC**

**22.1 DAC Introduction**

The chip integrates two DAC modules, where DAC0 is a 9-bit digital-to-analog converter, and DAC1 is a 6-bit digital-to-analog converter.

**22.2 DAC0 Functional Block Diagram**

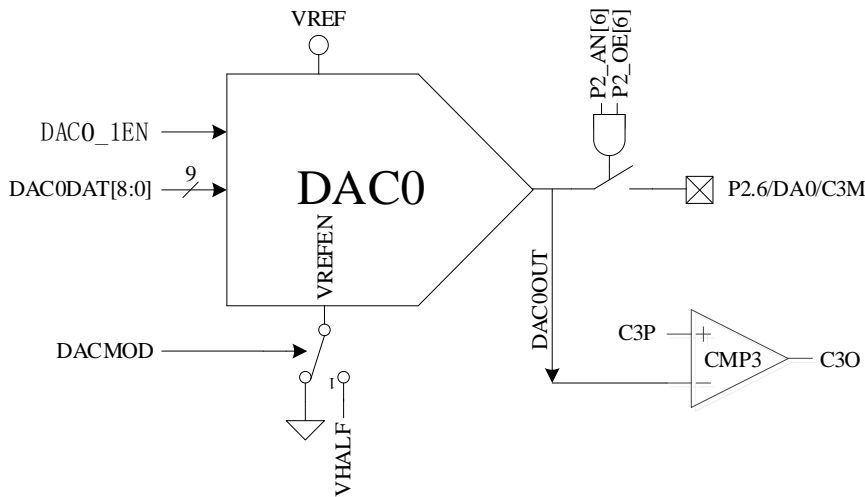

Figure 22-1 Functional Block Diagram of DAC0

As shown in Figure 22-1, DAC0 converts the 9-bit digital data to analog voltage. The voltage is sent to CMP3 negative input for bus overcurrent protection, while P2.6 can be configured as the analog output.

Note: DAC0 output has no current drive capability and can only carry capacitive load. To carry resistive load, operational amplifiers are used to follow the voltage output.

DAC0 operations are as follows:

1. Configure P2\_AN[6] = 1, P2\_OE[6] = 1, DAC0 output to P2.6;
2. Configure VREF\_CR [VREFEN] to 1 to select VREF as the reference voltage for DAC0, and set DAC\_CR[DAC0\_1EN] to 1 to enable DAC0;
3. The range of output voltage is selected by DAC\_CR[DACMOD]. When DAC\_CR[DACMOD]= 0, full-voltage output mode is active, and the range of output voltage is 0 ~ VREF. When DAC\_CR[DACMOD]= 1, half-voltage output mode is active, and the range of output voltage is VHALF ~ VREF. The output voltage of DAC0 in different modes are shown in Table 22-1.

Table 22-1 Voltage Output of DAC0 in Different Configurations

DAC0DAT[8:0]	DAC Output Voltage (DAC_CR[DACMOD] = 0)	DAC Output Voltage (DAC_CR[DACMOD] = 1)
0x000	0	VHALF
0x100	VREF/2	(VREF - VHALF)/2 + VHALF
0x1FF	VREF*511/512	(VREF - VHALF)*511/512 + VHALF

**22.3 DAC1 Functional Block Diagram**

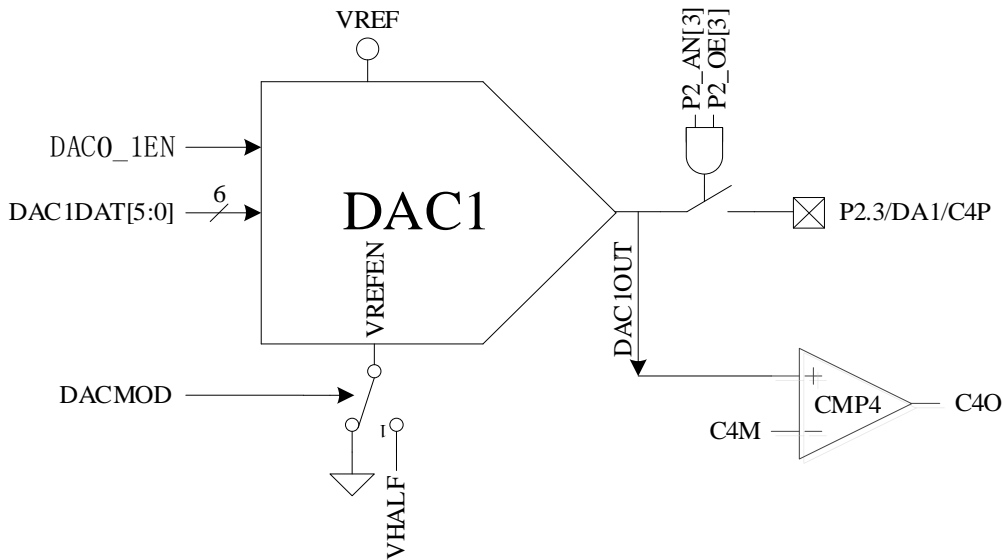

Figure 22-2 Functional Block Diagram of DAC1

As shown in Figure 22-2, DAC1 converts the 6-bit digital data to analog voltage and sends the voltage to the CMP4 positive input for cycle-by-cycle current limiting, while P2.3 can be configured as the analog output.

Note: DAC1 output no few current drive capability and can only carry capacitive load. To carry resistive load, operational amplifiers are used to follow the voltage output.

DAC1 operations are as follows:

1. Configure P2\_AN[3] = 1 and P2\_OE[3] = 1, DAC1 output to P2.3;
2. Configure VREF\_CR[VREFEN] to 1 to select VREF as the reference voltage for DAC0, and set DAC\_CR[DAC0\_1EN] to 1 to enable DAC1;
3. The range of output voltage is set by DAC\_CR[DACMOD]. When DAC\_CR[DACMOD] = 0, full-voltage output mode is active, and the output voltage range is 0 ~ VREF. When DAC\_CR[DACMOD] = 1, half-voltage output mode is active, and the output voltage range is VHALF ~ VREF. The output voltage of DAC1 under different configurations is shown in Table 22-2.

Table 22-2 Voltage DAC1 output in Different Configurations

DAC1DAT[5:0]	DAC Output Voltage (DAC_CR[DACMOD] = 0)	DAC Output Voltage (DAC_CR[DACMOD] = 1)
0x00	0	VHALF
0x20	VREF/2	(VREF-VHALF)/2 + VHALF
0x3F	VREF*63/64	(VREF - VHALF)*63/64 + VHALF

## 22.4 DAC Registers

**23 DMA**

**23.1 DMA Instructions**

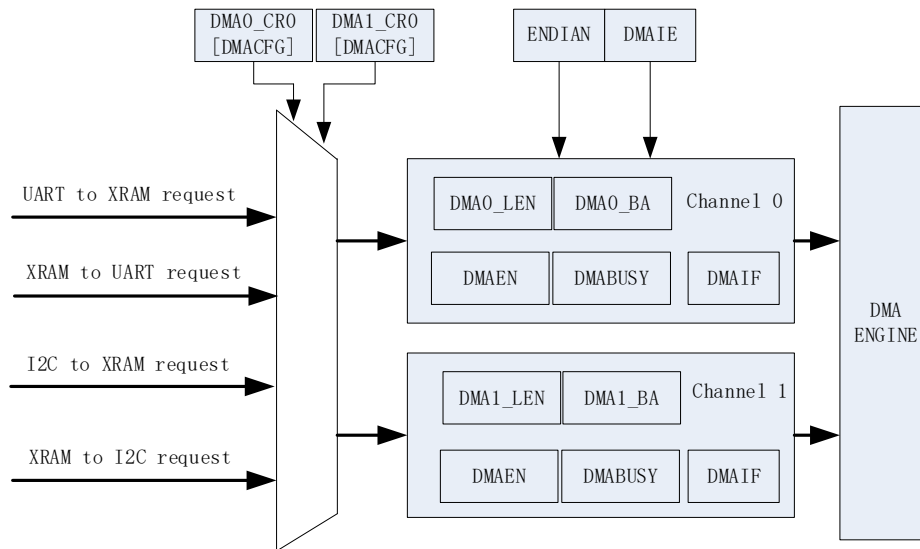

Figure 23-1 Functional Block Diagram of DMA

The DMA module is a dual-channel DMA controller, which performs direct data transfer between peripherals (UART and I<sup>2</sup>C) and XRAM (IRAM data invalid). DMA accessing to XRAM does not interfere with the normal CPU read/write operation to XRAM. The length of the transferred data and the start address of XRAM access is configurable. Data transfer mode is configurable and interrupt can be enabled.

DMA instructions are as follows:

1. Configure the peripheral and enable the peripheral, and set input and output channels taken over by DMA by DMA<sub>x</sub>\_CR0[DMACFG];
2. Configure DMA interrupt enable, transfer order, transfer length and XRAM start address. Write DMA<sub>x</sub>\_CR0[DMAEN] and DMA<sub>x</sub>\_CR0[DMABUSY] to 1 to start DMA;
3. After data transfer, the interrupt flag bit DMA<sub>x</sub>\_CR0[DMAIF] is set to 1 by hardware and it is cleared to 0 by software;
4. Set DMA<sub>x</sub>\_CR0[DMABUSY] to 1 to start DMA again.

## 23.2 DMA Registers

### 23.2.1 DMA0\_CR0 (0x403A)

Bit	7	6	5	4	3	2	1	0
Name	DMAEN	DMABSY	DMACFG			DMAIE	ENDIAN	DMAIF
Type	R/W	R/W1	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	DMAEN	DMA Channel 0 Enable 0: Disable 1: Enable						
[6]	DMABSY	DMA Channel 0 Busy State/Start Read: 0: Channel 0 is idle 1: Channel 0 is transmitting Write: 0: No effect 1: DMA channel 0 starts for data transfer						
[5:3]	DMACFG [2:0]	DMA Channel 0 Peripheral and Transfer Direction Selection 000: From UART1 to XRAM 001: From XRAM to UART1 010: From I <sup>2</sup> C to XRAM 011: From XRAM to I <sup>2</sup> C 110: From UART2 to XRAM 111: From XRAM to UART2  Note: It cannot be configured when DMA channel 0 is busy						
[2]	DMAIE	DMA Interrupt Enable 0: Disable 1: Enable						
[1]	ENDIAN	DMA Data Transfer Sequence 0: High byte is received or transmitted first 1: Low byte is received or transmitted first  Notes: This bit is set for 16-bit data mode, and shall be configured to “0” for 8-bit data mode. It cannot be configured when channel 0 or 1 is busy						
[0]	DMAIF	DMA Channel 0 Transfer Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to “0”. 1: The interrupt is generated.						

**23.2.2 DMA1\_CR0 (0x403B)**

Bit	7	6	5	4	3	2	1	0
Name	DMAEN	DMABSY	DMACFG			DBGSW	RSV	DMAIF
Type	R/W	R/W1	R/W	R/W	R/W	R/W	—	R/W
Reset	0	0	0	0	0	0	—	0
Bit	Name	Description						
[7]	DMAEN	DMA Channel 1 Enable 0: Disable 1: Enable						
[6]	DMABSY	DMA Channel 1 Busy State/Start Read: 0: Channel 1 is idle 1: Channel 1 is transmitting Write: 0: No effect 1: Channel 1 starts for data transfer						
[5:3]	DMACFG [2:0]	DMA Channel 1 Peripheral and Transfer Direction Selection 000: From UART1 to XRAM 001: From XRAM to UART1 010: From I <sup>2</sup> C to XRAM 011: From XRAM to I <sup>2</sup> C 110: From UART2 to XRAM 111: From XRAM to UART2  Note: It cannot be configured when DMA channel 1 is busy						
[2]	DBGSW	Debug Area Selection 0: XSFR as the debug area (exported address space: 0x4020 ~ 0x40FF) 1: XRAM as the debug area (exported address space: 0x0000 ~ 0x0317)						
[1]	RSV	Reserved						
[0]	DMAIF	DMA Channel 0 Transfer Interrupt Flag Read: 0: No interrupt pending 1: Interrupt pending Write: 0: This bit is cleared to 0 1: Generate interrupt						

**23.2.3 DMA0\_LEN (0x403C)**

Bit	7	6	5	4	3	2	1	0
Name	RSV		DMA0_LEN					
Type	—	—	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	—	0	0	0	0	0	0
Bit	Name	Description						
[7:6]	RSV	Reserved						
[5:0]	DMA0_LEN	DMA Channel 0 Transfer Length Setting Read: The number of the bytes currently transferred by DMA channel 0 (0 means the first byte) Write: DMA channel 0 XRAM transfer data length Note: It cannot be configured when DMA channel 0 is busy. When DMA0_CR0[ENDIAN] = 1 (low byte is received or sent first), it is recommended that DMA0_LEN be set to an odd number						

**23.2.4 DMA0\_BA (0x403E, 0x403F)**

DMA0_BAH(0x403E)								
Bit	15	14	13	12	11	10	9	8
Name	RSV					DMA0_BA[10:8]

[10:0]	DMA1_BA	DMA Channel 1 Transfer Data Start Address Setting DMA Channel 1 XRAM Start Address It cannot be configured when DMA channel 1 is busy  Notes: XRAM address space for data transfer by channel 1: DMA0_BA[10:0] ~ (DMA0_BA[10:0] + DMA0_LEN[5:0])
--------	---------	--

Note: When I<sup>2</sup>C is selected as DMA channel peripherals (including from I<sup>2</sup>C to XRAM and from XRAM to I<sup>2</sup>C), START + address interrupt for I<sup>2</sup>C communication still requires to be cleared to 0 by software. In I<sup>2</sup>C slave mode, if STOP is received, I2C\_SR[I2CSTP] = 0 is configured to clear I<sup>2</sup>C interrupt and restart the DMA transfer.

**24 VREF**

**24.1 VREF Instructions**

Figure 24-1 Diagram of VREF Module Input and Output

The input and output ports of the VREF module are shown in Figure 24-1. VREF is the voltage reference generation block that provides internal voltage reference to ADC and DAC module. VBG is the voltage provided by the chip internally.

VREF is enabled when VREF\_CR[VREFEN] is set to 1. The output voltage is selected by configuring VREF\_CR[VREFVSEL]. When P3\_AN[5] = 1, the VREF is output to P3.5 pin.

**25 VHALF**

**25.1 VHALF Instructions**

Figure 25-1 Diagram of VHALF Module Input and Output

The VHALF module input and output ports are shown in Figure 25-1. This module generates the voltage reference VREF/2.

VHALF is enabled when VREF\_CR[VREFEN] is set to 1, and the voltage is output to P3.2. A 1µF capacitor is added.

**25.2 VHALF Register**

See section 24.2.1.

**26 Operational Amplifiers**

**26.1 Operational Amplifier Introduction**

The chip integrates three high-speed independent operational amplifiers, AMP0, AMP1, and AMP2. Each operational amplifier has a separate enable bit. AMP0 can be configured as a programmable gain amplifier.

Figure 26-1 Schematic Diagram of Operational Amplifier module

**26.2 Operational Amplifier Instructions**

**26.2.1 Bus Current Sampling Operational Amplifier (AMP0)**

AMP0 operates in normal mode or PGA differential input mode.

**26.2.1.1 AMP0 Normal Mode**

Figure 26-2 Diagram of Bus Current Operational Amplifier AMP0

The ports corresponding to inputs and outputs of the bus current operational amplifier are shown in Figure 26-2. AMP0 is enabled when AMP\_CR[AMP0EN]= 1, and P2.7, P3.0, and P3.1 are automatically configured to analog signal mode by the hardware.

**26.2.1.2 AMP0 PGA Differential Input Mode**

Figure 26-3 Diagram of AMP0 PGA Differential Input Mode

As shown in Figure 26-3, positive and negative inputs of AMP0 are connected with a 1kΩ resistor in the external circuit respectively.

When PGA differential Input Mode is selected for AMP0, the amplification gain is set by AMP0\_GAIN and AMP0 is enabled when AMP\_CR[AMP0EN] = 1. The relationship between the output and the input of operational amplifier is:  $V_{out} = V_{HALF} + (V_1 - V_2) * AMP0\_GAIN$ .

**26.2.2 Phase Current Operational Amplifier (AMP1/AMP2)**

**26.2.2.1 AMP1**

Figure 26-4 Diagram of AMP1 Input and Output

The ports corresponding to the phase current operational amplifier inputs and outputs are shown in Figure 26-4. The phase current operational amplifier AMP1 is enabled when AMP\_CR[AMP1EN] = 1, and P1.6, P1.7, and P2.0 are automatically configured to analog signal mode by the hardware.

26.2.2.2 AMP2

Figure 26-5 Diagram of AMP2 Input and Output

The ports corresponding to the phase current operational amplifier inputs and outputs are shown in Figure 26-5. The phase current operational amplifier AMP2 is enabled when  $CMP\_CR[AMP2EN] = 1$ , and P2.1, P2.2, and P2.3 are automatically configured to analog signal mode by the hardware.

Reset	—	—	—	—	—	0	0	0
Bit	Name	Description						
[7:3]	RSV	Reserved						
[2:0]	AMP0_GAIN	Operational Amplifier Gain Setting 000: The gain is configured by the external circuit 001: 2x 010: 4x 011: 8x 100: 16x 101: 32x 110: Reserved 111: Reserved  Note: The built-in amplification is isotropic amplification. When the difference of input voltage is 0, the output voltage is VHALF. For other applications, AMP0_GAIN is set to 000 to select external circuit to configure the gain.						

**27 Comparator**

**27.1 Comparator Operations**

**27.1.1 CMP3**

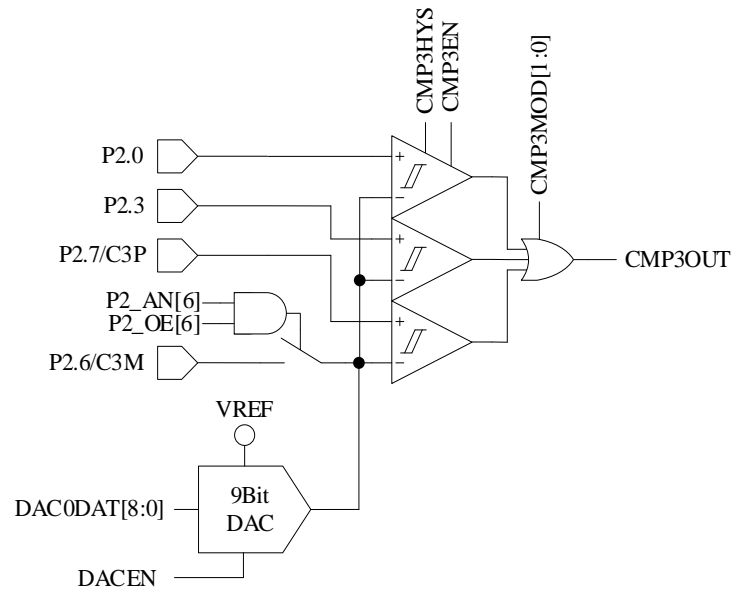

Figure 27-1 CMP3 Input and Output Pins

The input and output pins of CMP3 are shown in Figure 27-1.

The configuration of CMP3 is as follows:

1. Configure P2\_AN[6] and P2\_OE[6] to 1 to enable CMP3 and VREF on the negative input. The VREF source can be the on-chip DAC0 output voltage or the external circuit input voltage. Select DAC0 output, and place an external capacitance between P2.6 pin and GRND (the recommended capacitance value is 100pF, and the output voltage stabilizes after DAC0 output for a period of time);
2. Configure CMP\_CR1[CMP3MOD] to select single comparator input, dual comparator input or triple comparator input mode;
  - When CMP3MOD = 00, CMP3 works in single comparator input mode. The connection of input and output pins are shown in Figure 27-2.
  - When CMP3MOD = 01, CMP3 works in dual comparator input mode. The connection of input and output pins are shown in Figure 27-3.
  - When CMP3MOD = 1X, CMP3 works in triple comparator input mode. The connection of input and output pins are shown in Figure 27-4.
3. Configure CMP\_CR1[CMP3HYS] to enable or disable hysteresis;
4. Set CMP\_CR1[CMP3EN] = 1 to enable CMP3.

Figure 27-2 Single-comparator Input Mode

Figure 27-3 Dual-comparator Input Mode

Figure 27-4 Triple-comparator Input Mode

**27.1.1.1 Overcurrent Protection (OCP)**

When an overcurrent protection signal is generated, DRV\_OUT[MOE] is automatically cleared to output idle voltage to stop the motor drive for chip and motor protection. OCP feature is enabled when EVT\_FILT[MOEMD] = 01, which automatically turns off the output and generates an OCP interrupt request if the current exceeds the threshold. When EVT\_FILT[MOEMD] = 0, the output is not automatically turned off if the current exceeds the threshold. However, an OCP request is generated by the hardware.

The source of OCP interrupt is selected from CMP3 or INT0 by configuring EVT\_FILT[EFSRC]. When EVT\_FILT[EFSRC] = 1, the TCON[IT0] bit is programmed to select the trigger edge of the external interrupt INT0 which generates an OCP output. At this time, the source of OCP interrupt is INT0. When EVT\_FILT[EFSRC] = 0 and CMP\_CR0[CMP3IM] = 11, the OCP output is generated on the raising edge of CMP3. At this time, the source of OCP interrupt is CMP3. In triple-shunt current sampling mode, CMP\_CR1[CMP3MOD] is configured to select triple-comparator input mode. When current of any phase is over the threshold, CMP3 generates an OCP signal. For other sampling modes, CMP\_CR1[CMP3MOD] is configured to choose single-comparator input mode. When bus current is over the threshold, CMP3 generates an OCP signal.

Setting EVT\_FILT[EFDIV] enables the filtering of interrupt signals for OCP, and programming EVT\_FILT[EFDIV] = 01/10/11 selects filter width of 4/8/16 clock cycles. When the filtering feature is enabled, the filtered signal is delayed by 4/8/16 clock cycles compared to the signal before filtering.

**27.1.1.2 Cycle-by-Cycle Current Limiting**

The Cycle-by-Cycle current limiting feature is applied to square wave-based drive control of BLDC motors. When an OCP event occurs, DRV\_OUT[MOE] is set to 1 after it has been cleared to “0” for a period of time, so that the motor

drive automatically restored. When  $CMP\_CR0[CMP3IM] = 11$ ,  $DRV\_OUT[MOE]$  is cleared to 0 on the rising edge of  $CMP3OUT$  to protect motor. When  $EVT\_FILT[MOEMD] = 10$ , the outputs are automatically turned off upon an OCP interrupt.  $DRV\_OUT[MOE]$  is enabled automatically upon Driver counter overflow/underflow events or after  $10\mu s$  to restore motor drive. When  $EVT\_FILT[MOEMD] = 11$ , the output is turned off upon an OCP interrupt.  $DRV\_OUT[MOE]$  is automatically enabled after  $5\mu s$  or upon Driver counter overflow/underflow to restore motor drive.

Figure 27-5 Cycle-by-Cycle Current Limiting Waveform ( $t_2 - t_1 = 10\mu s$ ) when  $EVT\_FILT[MOEMD] = 10$

Figure 27-6 Cycle-by-Cycle Current Limiting Waveform ( $t_2 - t_1 = 5\mu s$ ) when  $EVT\_FILT[MOEMD] = 11$

**27.1.2 CMP4**

CMP4 is a hysteresis comparator as shown in Figure 27-7. CMP4OUT can be read by software or reversed on external interrupt INT0. When CMP3 is used for Cycle-by-Cycle current limiting protection, CMP4 is used for bus current protection. Output must be turned off by software when bus current OCP feature of CMP4 is triggered.

The configuration of CMP4 is as follows:

1. Configure P2\_AN[3]= 1 and P2\_OE[3]= 1 to enable VREF on the positive input of CMP4. The VREF source can be the on-chip DAC1 output voltage or the external circuit input voltage. Select DAC1 output, and place an external capacitance between P2.3 pin and GRND (the recommended capacitance value is 100pF, and the output voltage stabilizes after DAC1 output for a period of time);
2. Configure P2\_AN[7] = 1 to assign P2.7 pin to analog signal;
3. Configure CMP\_CR2[CMP4EN] = 1 to enable CMP4;
4. Clear INT0 flag bit to enable INT0;
5. Set LVSR[EXT0CFG] = 111 to select CMP4 as the source of INT 0;
6. Configure TCON[IT0] = 01 to select falling edge triggered INT0.

Figure 27-7 Schematic Diagram of CMP4 Module

**27.1.3 Comparator Group (CMPG)**

The comparator group CMPG is a collection of CMP0, CMP1 and CMP2, with multiple comparison modes for different applications.

When CMP\_CR2[CMP0MOD]= 00, CMPG works in the mode of three comparators without built-in resistor. It is used for BEMF detection with the external virtual neutral point resistors. The input and output pins are shown in Figure 27-8. The negative inputs of the three comparators are connected together to P1.5, and the positive inputs are connected to P1.4, P1.6 and P2.1. The outputs are CMP0OUT, CMP1OUT, and CMP2OUT respectively. The number of comparators working in this mode is determined by CMP\_CR2[CMP0SEL]. When CMP\_CR2[CMP0SEL] = 00, CMP0, CMP1 and CMP2 work simultaneously, which is the recommended setting. When CMP\_CR2[CMP0SEL]= 01, only CMP0 works. When CMP\_CR2[CMP0SEL]= 10, only CMP1 works. When CMP\_CR2[CMP0SEL]= 11, only CMP2 works.

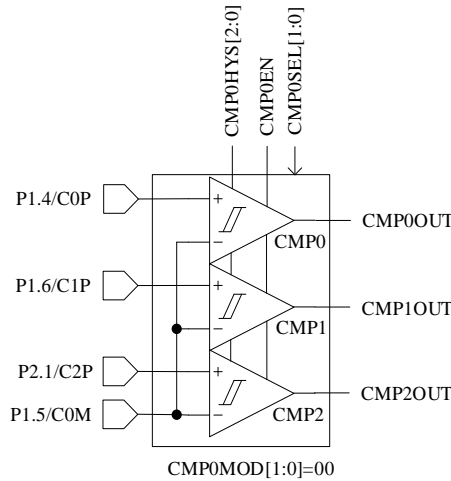

Figure 27-8 CMPG Mode with Built-in Three Comparators  
(without Built-in Resistor)

When  $CMP\_CR2[CMP0MOD]=01$ , CMPG works in the mode of three comparators with built-in resistors. It is used for BEMF detection with the internal virtual neutral point resistors. The input port is selected by setting the functional switching bit  $CMP\_CR4[CMP0FS]$ . The number of comparators operating in this mode is determined by  $CMP\_CR2[CMP0SEL]$ . When  $CMP\_CR2[CMP0SEL] = 00$ , CMP0, CMP1 and CMP2 comparators work simultaneously, which is the recommended setting. When  $CMP\_CR2[CMP0SEL] = 01$ , only CMP0 works and CMP1, CMP2 are idle. When  $CMP\_CR2[CMP0SEL] = 10$ , only CMP1 works. When  $CMP\_CR2[CMP0SEL] = 11$ , only CMP2 works.

When  $CMP\_CR4[CMP0FS] = 0$ , The input and output pins are shown in Figure 27-9. The negative inputs of the three comparators are connected together to the neutral point of the built-in resistors. The positive inputs are connected to P1.4, P1.6 and P2.1, and the outputs are CMP0OUT, CMP1OUT, and CMP2OUT, respectively.

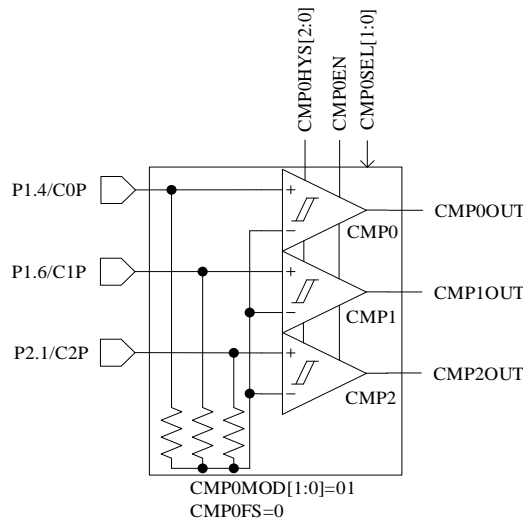

Figure 27-9 CMPG Mode with Built-in Three Comparators and Resistors  
(without Functional Switching)

When  $CMP\_CR4[CMP0FS]=1$ , the input and output pins are shown in Figure 27-10. The negative inputs of the three comparators are connected together to the neutral point of the built-in resistors, the positive inputs are connected to P1.4, P1.3 and P1.5 respectively, and the outputs results are CMP0OUT, CMP1OUT and CMP2OUT respectively.

Figure 27-10 CMPG Mode with Built-in Three Comparators (with Functional Switching)

When  $CMP\_CR2[CMP0MOD]=10$ , CMPG mode with three differential comparators is selected for the differential Hall sensor to detect the motor rotor position. The input and output pins are shown in Figure 27-11. The negative inputs of the three comparators are respectively connected to P1.5, P1.7 and P2.2, the positive inputs are respectively connected to P1.4, P1.6 and P2.1, and the outputs are CMP0OUT, CMP1OUT and CMP2OUT respectively. In this mode, the number of comparators is determined by  $CMP\_CR2[CMP0SEL]$ . When  $CMP\_CR2[CMP0SEL]=00$ , CMP0, CMP1 and CMP2 work simultaneously, which is the recommended setting. When  $CMP\_CR2[CMP0SEL]=01$ , only CMP0 works. When  $CMP\_CR2[CMP0SEL]=10$ , only CMP1 works. When  $CMP\_CR2[CMP0SEL]=11$ , only CMP2 works.

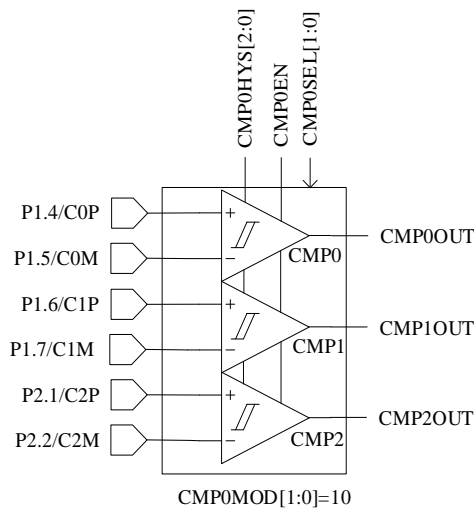

Figure 27-11 CMPG Mode with Three Differential Comparators

When  $CMP\_CR2[CMP0MOD] = 11$ , CMPG mode with two comparators is selected for motor speed detection. The input and output ports are shown in Figure 27-12. The negative inputs of the comparators are connected together to P1.5, the positive inputs are connected to P1.4 and P1.3, and the outputs are CMP0OUT and CMP1OUT respectively. In this mode, the number of comparators is determined by  $CMP\_CR2[CMP0SEL]$ . When  $CMP\_CR2[CMP0SEL] = 00$ , CMP0 and CMP1 work simultaneously, which is the recommended setting. When  $CMP\_CR2[CMP0SEL] = 01$ , only CMP0 works and CMP1 is idle. When  $CMP\_CR2[CMP0SEL] = 10$ , only CMP1 works and CMP0 is idle.

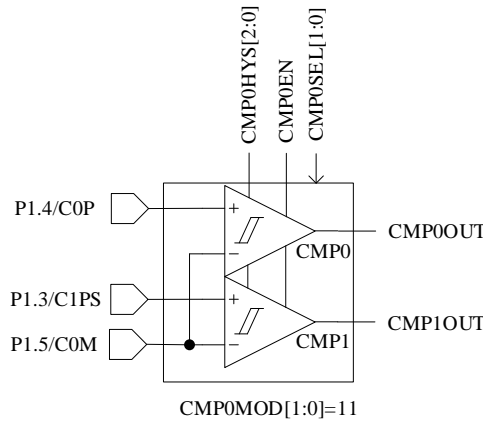

Figure 27-12 CMPG Mode with Two Comparators

The output signals of CMP0/CMP1/CMP2 are sent to Timer1 after filtering and sampling modules.

### 27.1.4 Comparator Sampling

The comparator sampling feature is mainly used for the square wave control and RSD, which eliminates the switching interference from driving circuit. See CMP/GPIO Position Detection Event for square wave control in 13.1.2.3 and RSD Comparator Sampling for RSD in 14.1.7.1.

Figure 27-13 PWM ON Sampling Mode

There is a delay from PWM output to the output of the comparator, which is mainly affected by the following factors: resistance value of the drive resistor, switching speed of the power device, and input delay and hysteresis settings of the comparator. As shown in Figure 27-13, the delay time is from the chip output to the comparator output. When high-level sampling is performed, the sampling interval shall be enveloped by the actual high-level output of the comparator. First, the sampling ON-delayed time  $CMP\_SAMR[CSOND]$  is set to overcome the output delay and the

oscillation interval of the power device. At the end of the sampling interval, CMP [ CSOND ] is delayed after the falling edge of PWM, at which time the actual sampling window has exceeded the corresponding high-level interval. The sampling OFF-advanced time CMP\_SAMR[CSOFFD] is set to stop sampling Toffdelay after the PWM output falling edge, where  $Toffdelay = CMP\_SAMR[CSOND] - CMP\_SAMR[CSOFFD]$ . By configuring CMP\_SAMR[CSOND] and CMP\_SAMR[CSOFFD], the sampling interval can be located in the high-level interval of the actual output of the comparator.

Figure 27-14 PWM OFF Sampling Mode

Similarly, when low-level sampling is performed, the sampling ON-delayed time CMP\_SAMR[CSOND] and the sampling OFF-advanced time CMP\_SAMR[CSOFFD] are set reasonably to ensure that the actual sampling interval is located in the actually low-level output interval of the comparator.

Method for measuring the delay of PWM output to comparator: Set CMP\_CR3[SAMSEL] = 00 to disable the comparator sampling delay feature. Set CMP\_CR3[CMPSSEL] to select the corresponding comparator output to test pin P0.7. Enable the PWM output and comparator, manually rotate the motor to change the comparator value, and measure the delay between the PWM output and the comparator output.

### 27.1.5 Comparator Output

CMP\_CR3[CMPSSEL] is configured to output results of one comparator to P0.7.

**28 Power Supply**

**28.1 LDO**

The chip contains two internal LDO output modules: VDD5 and VDD18.

**28.1.1 LDO Operations**

Figure 28-1 Functional Block Diagram of Power Supply

The corresponding input and output ports of the LDO module are shown in Figure 28-1. The LDO module converts the input supply voltage to 5V (VDD5) and 1.8V (VDD18) as the power supply for internal analog and digital modules of the chip, respectively. Internal LDO5 or external supply for VDD5 is selected by configuring VCC\_MODE. As shown in Figure 30-2, in the debugging tool, VCC\_MODE = 0 if Vcc Mode is unchecked, where internal LDO supplies VDD5 voltage. VCC\_MODE = 1 if Vcc Mode is checked, where external 5V power supply is connected to VDD5 pin.

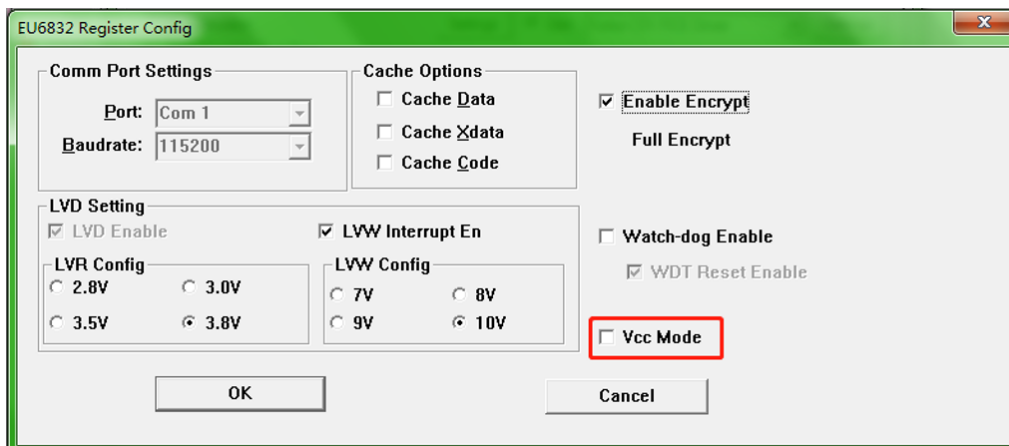

Figure 28-2 VCC\_MODE Configuration

## 28.2 Low Voltage Detector (LVD)

### 28.2.1 LVD Introduction

The low voltage detector has two main features: low voltage warning and low voltage reset.

### 28.2.2 LVD Operations

Figure 28-3 LVD Module

The operating instructions for LVD are as follows:

- LV warning and LV reset are always enabled by default.
- 7V/8V/9V/10V can be selected for LV warning threshold. When the interrupt feature is enabled, an interrupt is triggered if VCC voltage is lower than the LV warning threshold.
- 2.8V/3.0V/3.5V/3.8V can be selected for the LV warning threshold. The chip resets when VCC voltage settles below the LV reset voltage threshold.

The LV warning threshold, interrupt configuration and low voltage reset threshold are configured through debugging tool, as shown in Figure 28-4.

LVR Config sets low voltage reset threshold, LVW Interrupt En enables the LV interrupt, and LVW Config sets the low voltage warning threshold.

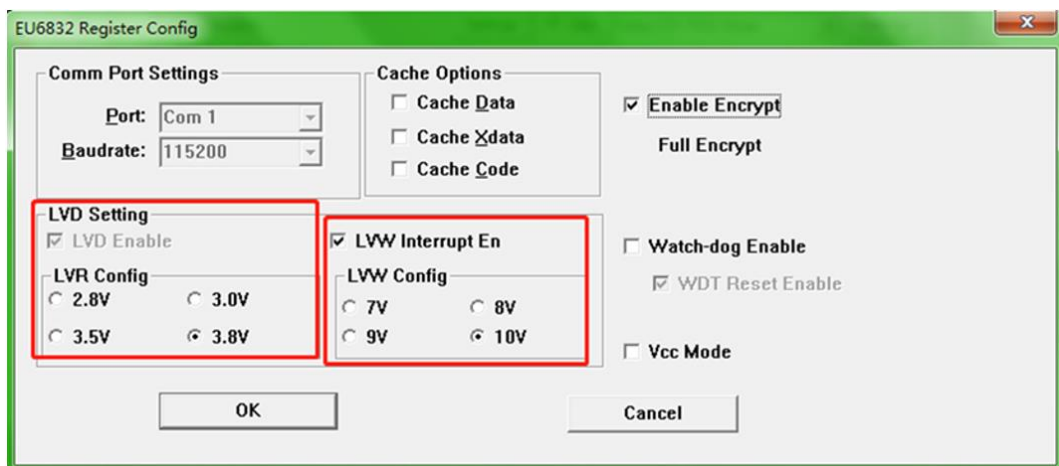

Figure 28-4 Configuration of LV Warning Threshold, LV Interrupt and LV Reset Threshold

## 29 Flash

### 29.1 Flash Introduction

The chip provides 16k bytes of on-chip Flash space. It supports chip erase/write and sector erase/write.

Features:

- There are 128 sectors in total, each with a size of 128 bytes.
- The last sector (address range: 0x3F80 to 0x3FFF) cannot be erased at any moment.
- Sector erase and chip erase takes about 120ms ~ 150ms.

### 29.2 Flash Operations

- All interrupts must be disabled before self-programming to ensure the security of Flash operations and avoid mis-operation of Flash using MOVX instruction during interrupt processing.
- Flash memory shall be unlocked before operation. The Flash software programming feature is activated after 0x5A and 0x1F are written to register FLA\_KEY in sequence. If the sequence is incorrect or other values are written, Flash space is frozen until the next reset. After unlocking, any write to FLA\_CR causes FLA\_KEY to be locked again.
- CRC results change if Flash memory is rewritten during program execution.

### 29.3 Flash Register

#### 29.3.1 FLA\_CR (0x85)

Bit	7	6	5	4	3	2	1	0
Name	RSV			FLAERR	RSV	FLAPRE	FLAERS	FLAEN
Type	—	—	—	R	—	R/W	R/W	R/W

[1:0]	FLAKSTA	Read: Flash Unlock Status 00: Locked 01: Write of 0x5A is done, waiting for write of 0x1F 10: Frozen 11: Unlocked						

**30 CRC**

**30.1 CRC Functional Block Diagram**

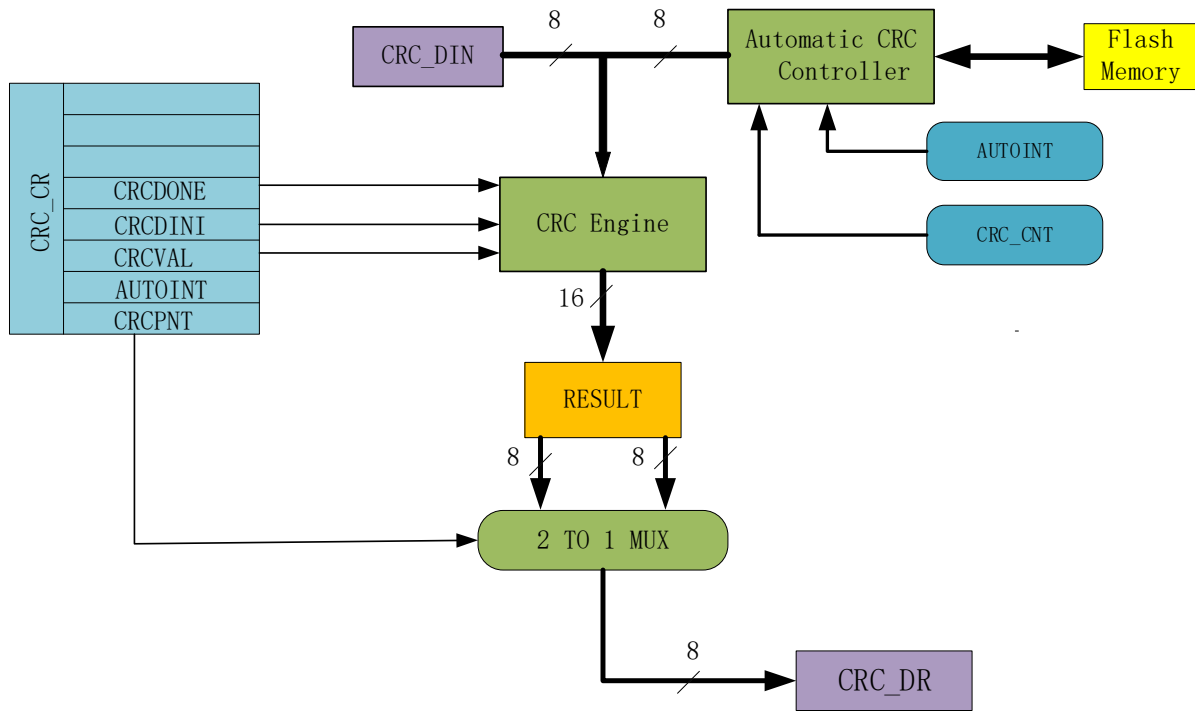

Figure 30-1 CRC Functional Block Diagram

CRC module outputs the result of CRC calculation for any 8-bit data based on a fixed polynomial. As shown in Figure 30-1, CRC receives the 8-bit data from CRC\_DIN and sends the 16-bit result to the internal register after the calculation is completed. The result can be indirectly accessed through CRC\_CR[CRCPNT] and CRC\_DR.

Table 30-1 CRC Criteria and Polynomials

No.	CRC Criteria	Polynomial	Hexadecimal Representation
1	CRC12	$x^{12}+x^{11}+x^3+x^2+x+1$	0x80F
2	CRC16	$x^{16}+x^{15}+x^2+1$	0x8005
3	CRC16/ CCITT-FALSE	$x^{16}+x^{12}+x^5+1$	0x1021
4	CRC32	$x^{32}+x^{26}+x^{23}+x^{22}+x^{16}+x^{12}+x^{11}+x^{10}+x^8+x^9+x^5+x^4+x+1$	0x04C11DB7

**30.2 CRC16 Polynomial**

The chip uses CRC16/CCITT-FALSE polynomial:  $x^{16}+x^{12}+x^5+1$ .

**30.3 CRC16 Logic Diagram**

Figure 30-2 presents the schematics of CRC16. The chip implementation is based on parallel algorithm. For each input byte, MCU calculates the results within 1 system clock cycle.

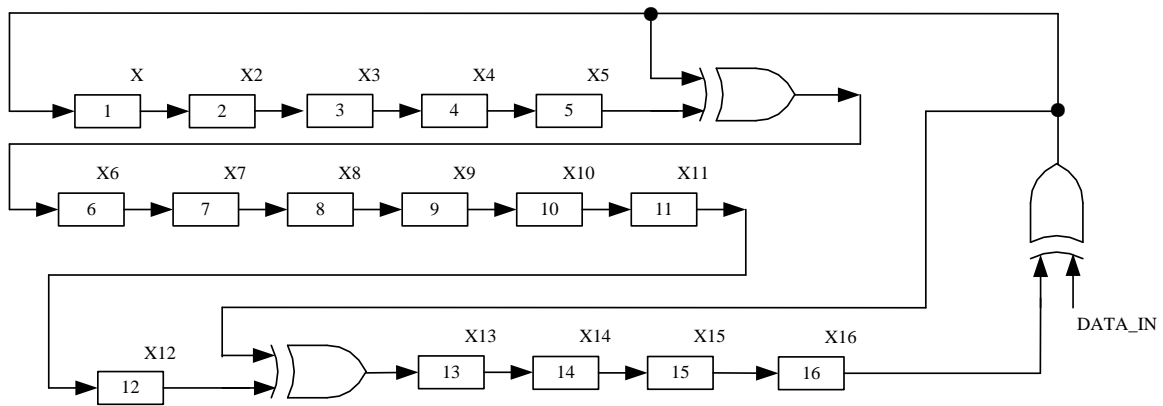

Figure 30-2 CRC16 Schematic Diagram

### 30.4 CRC Operations

#### 30.4.1 CRC Calculation of a Single Byte

CRC of a single byte is calculated as follows:

1. Initialize CRC\_DR with two options: Configure CRC\_CR[CRCVAL] and set CRC\_CR[CRCDINI] to 1, with an initial value of 0x0000 or 0xFFFF. Or configure CRC\_CR[CRCPNT] and CRC\_DR, where any initial value can be set;
2. Write data to CRC\_DIN, and CRC calculation is completed in the next system clock cycle;
3. Read CRC value: Configure CRC\_CR[CRCPNT] = 1, and read off CRC\_DR in software to get the high-order bytes. Configure CRC\_CR[CRCPNT] = 0, and read off CRC\_DR to get the low-order bytes.

#### 30.4.2 CRC Calculation of ROM Sector

CRC of a continuous area of data in the ROM is calculated as follows:

1. Initialize CRC\_DR in the same way as that of single-byte CRC calculation;
2. Configure CRC\_BEG to define starting sector of the ROM to be calculated;
3. Configure CRC\_CNT to set the offset from the starting sector to the ending sector;
4. Write 1 to CRC\_CR[AUTOINT] and keep other bits unchanged. The calculation starts automatically;
5. Read the CRC results.

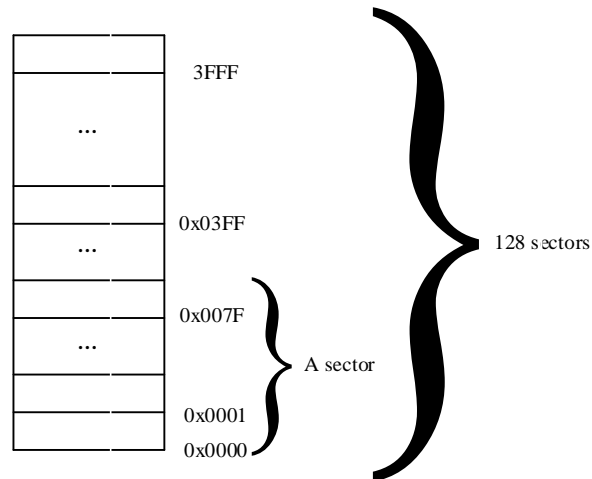

Figure 30-3 ROM Sectors

As shown in Figure 30-3, ROM has 16k bytes and is divided into 128 sectors numbered from sector0 to sector127. Each sector contains 128 bytes. For CRC calculation of sectors, the value of CRC\_BEG (the starting sector) can be any value between 0x00 ~ 0x7F, including 0x00 and 0x7F. the value of CRC\_CNT (the total number of sectors to be calculated) can be any value between 0x00 ~ 0x7F, including 0x00 and 0x7F.

As CRC\_BEG increases, CRC\_CNT decreases accordingly. For example, if CRC\_BEG is 0x7F, CRC\_CNT can be 0x00 only, i.e. the CRC value of the data in the last sector is calculated. In this case, if the value of CRC\_CNT is large, CRC controller automatically limits the number of sectors to be calculated. Finally, CRC module only calculates CRC value of the last sector.

### 30.5 CRC Registers

#### 30.5.1 CRC\_CR (0x4022)

Bit	7	6	5	4	3	2	1	0
Name	RSV			CRCDONE	CRCDINI	CRCVAL	AUTOINT	CRCPNT
Type	—	—	—	R	W1	R/W	W1	R/W
Reset	—	—	—	1	0	0	0	0
Bit	Name	Description						
[7:5]	RSV	Reserved						
[4]	CRCDONE	Automatic CRC Calculation Completed Flag During the calculation, this bit is automatically set to 0 by the hardware, and the software program stops. In other cases, this bit is automatically set to 1 by the hardware, so the software always returns 1 when reading this bit.						
[3]	CRCDINI	CRC Result Initialization Trigger 0: No effect 1: CRC result initialization is triggered.						
[2]	CRCVAL	CRC Result Initialization Selection 0: CRC result is initialized to 0x0000 1: CRC result is initialized to 0xFFFF						
[1]	AUTOINT	Sector CRC Auto-calculation Start 0: No effect 1: Sector CRC auto-calculation starts See CRC Calculation of ROM Sector.						
[0]	CRCPNT	CRC Result Pointer 0: Read CRC_DR to accesses 8 low-order bits of the 16-bit CRC result 1: Read CRC_DR to accesses 8 high-order bits of the 16-bit CRC result						

Note: CRC\_CR[AUTOINT] is set to 0 to perform single-byte CRC checksum.

#### 30.5.2 CRC\_DIN (0x4021)

Bit	7	6	5	4	3	2	1	0
Name	CRC_DIN							
Type	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	CRC_DIN	CRC Input Data Each time a data frame is written to this register, CRC module automatically calculates a new CRC result based on the existing CRC result and overwrites the original one.  Note: This register is a virtual register, so the written data is not saved. 0x00 is returned when the address is accessed.						

**30.5.3 CRC\_DR (0x4023)**

Bit	7	6	5	4	3	2	1	0
Name	CRC_DR							
Type	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	Name	Description						
[7:0]	CRC_DR	CRC Result Output Each time this register is read or written, CRC module determines to access 8 high-order bits or 8 lower-order bits of the CRC result according to CRC_CR[CRCPNT].						

**30.5.4 CRC\_BEG (0x4024)**

Bit	7	6	5	4	3	2	1	0
Name	RSV	CRC_BEG						
Type	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	RSV	Reserved						
[6:0]	CRC_BEG	First ROM Sector Pending Auto CRC Calculation For example, if CRC_BEG is set to 1, CRC calculation starts from the location $1 * 128 = 128$ , or rather from the first byte of sector 2.						

**30.5.5 CRC\_CNT (0x4025)**

Bit	7	6	5	4	3	2	1	0
Name	RSV	CRC_CNT						
Type	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	—	0	0	0	0	0	0	0
Bit	Name	Description						
[7]	RSV	Reserved						
[6:0]	CRC_CNT	Offset of Sector Pending Automatic CRC Calculation This bit defines the offset of ROM sector for CRC calculation and determines the last sector pending CRC calculation.						

## 31 Sleep Mode

### 31.1 Introduction

The chip operates in three modes: Normal, Standby and Sleep. These modes are selected by setting PCON[IDLE] and PCON[STOP].

The operating states of the module under different power modes are summarized in Table 31-1.

Table 31-1 Power Modes

Power Mode	Description	Wake-up Source	Power Consumption Performance
Normal	All modules work at full speed except for peripherals that are disabled	NA	High power consumption with best performance
Standby	CPU clock stops and the other functional modules are enable or disabled, depending on their control bit setting. Watchdog Timer stops.	Any interrupt, Reset/Debug on external interrupt	Low power consumption with flexible performance
Sleep	Flash Deep Sleep. The analog fast clock circuit is disconnected and software shall be operated to check if ADC, FOC and driver modules are disabled before the chip enters the Sleep mode. Watchdog Timer is disabled.	External interrupt, RTC interrupt, Reset/Debug on external interrupt	Extremely low power consumption with flexible performance

Note: It is recommended to insert 3 null statements in the sleep mode.

## 31.2 Sleep Mode Register

### 31.2.1 PCON (0x87)

Bit	7	6	5	4	3	2	1	0
Name	RSV		GF3	GF2	GF1	RSV	STOP	IDLE
Type	—	—	R/W	R/W	R/W	—	R/W	R/W
Reset	—	—	0	0	0	—	0	0
Bit	Name	Description						
[7:6]	RSV	Reserved						
[5]	GF3	General Flag Bit 3						
[4]	GF2	General Flag Bit 2						
[3]	GF1	General Flag Bit 1						
[2]	RSV	Reserved						
[1]	STOP	A write of “1” makes the chip enter the Sleep mode. This bit is automatically cleared to “0” by the hardware after wakeup.						
[0]	IDLE	A write of “1” makes the chip enter the Standby mode. This bit is automatically cleared to “0” by the hardware after wakeup.						

Power consumption mode PCON[STOP:IDLE]:

00: Normal

01: Standby

1X: Sleep

## 32 Code Protection

### 32.1 Introduction

The chip supports full Flash space encryption to protect your software intellectual property and avoid unauthorized access. When Flash memory is encrypted, the data inside cannot be read, and data consistency can be evaluated by CRC check module only.

### 32.2 Operating Instructions

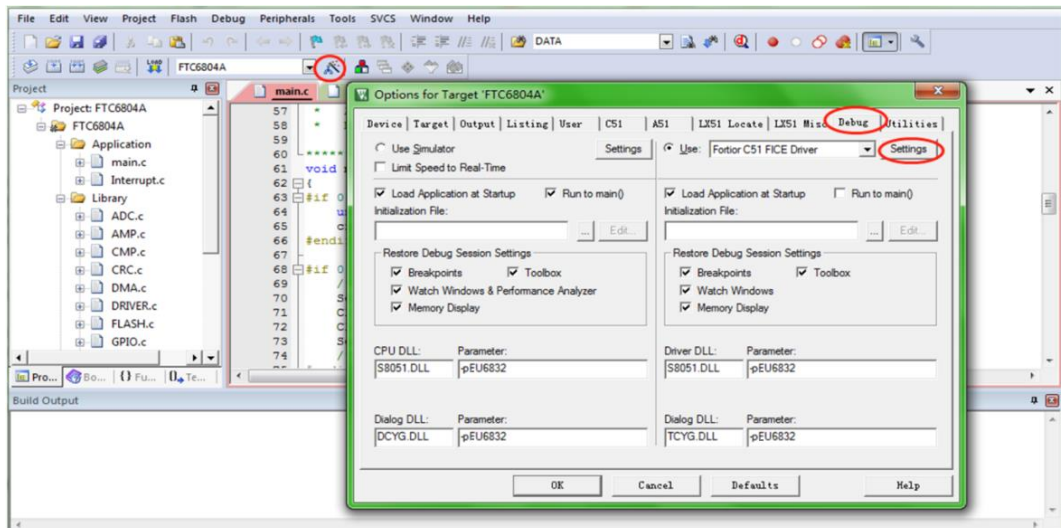

Figure 32-1 Code Protection Configurations

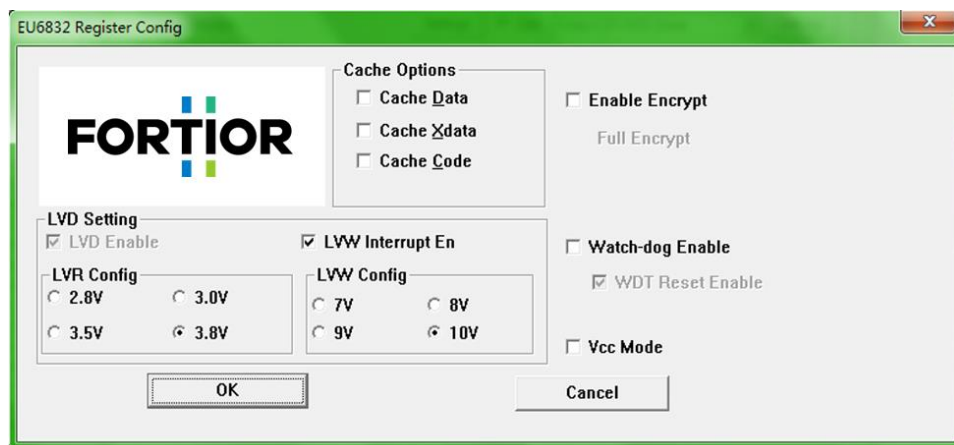

Figure 32-2 Full Code Protection Mode

Operation steps are as follows:

1. Start 8051 IDE, enter Target Options and select Debug tab. As shown in Figure 32-1, click Settings to proceed with the setting;
2. Select the options as shown in Figure 32-2, and click OK. Then compile the project and download it. Get the BIN file and program it to Flash.

**33 Revision History**

<b>Rev.</b>	<b>Description</b>	<b>Date</b>	<b>Prepared By</b>
V0.2	Preliminary datasheet, translated from Chinese version 0.2.	2023/01/05	Lydia Zhu
V0.3	<ol style="list-style-type: none"><li>1. Adopted Document Standard V7.7.02;</li><li>2. Corrected model name typo in Pin List.</li></ol>	2023/02/03	Lydia Zhu
V1.0	Final datasheet. <ol style="list-style-type: none"><li>1. Updated Chapter 1 ~ Chapter 5;</li><li>2. Added Chapter 6 ~ Chapter 32;</li><li>3. Optimized document format.</li></ol>	2023/08/23	Eric Deng
